Einleitung.

Das Netz der meteorologischen Stationen hat im Berichtsjahre eine weitere wertvolle Ergänzung erhalten durch Etablierung eines ständigen Beobachtungspostens auf dem Bachtelkulm (1110 m) ob Wald (Kt. Zürich), wo es möglich war noch bis Ende des Jahres die nötigen Instrumente zu installieren. Ferner gelang es, nach Verhandlungen mit der Waisenhausverwaltung der Stadt Zürich, einen schon längst gehegten Plan zu verwirklichen, nämlich die Eröffnung einer einfachen Station für Temperaturbeobachtung und Niederschlagsmessung im eigentlichen Weichbild der Altstadt Zürich selbst, behufs Ausführung der notwendigen Parallelbeobachtungen zwischen Stadt und dem Hange des Zürichberges (Höhendifferenz ca. 80 m), wo gegenwärtig die Station der meteorologischen Centralanstalt sich befindet.

Das Netz der ombrometrischen Stationen ist wieder um ein bedeutendes erweitert worden durch Gewinnung neuer Beobachter in: Ecône-Riddes (Wallis), Plantahof-Landquart (Graubünden), Grindelwald, Bernina-Hospiz, Birchera (Freiburg), Eigergletscher, Kaiserstuhl (Aargau), Affoltern (Bern) und Anstalt für Epileptische bei Zürich. Eingegangen sind die meteorologischen Stationen in Ste-Croix und Château d'Oex, wo wiederholte Bemühungen, eine zuverlässige Weiterführung zu erlangen, bis jetzt fruchtlos geblieben sind. Auf Ende 1908 ist an insgesamt 112 meteorologischen und 263 Regenmess-Stationen regelmässig beobachtet worden.

Leider hat die Anstalt im Berichtsjahre den Verlust von drei langjährigen, treuen Beobachtern, des Pfarrers Manzoni in Braggio, des Zolleinnehmers Christian Lorez in Splügen und des Gemeindeschreibers Fischer in Guttannen, erlitten; an allen drei Orten ist es indessen wieder gelungen, teils durch Familienglieder, teils durch anderweitige Hülfe, die Stationen ohne Unterbrechung weiterzuführen.

Ihre ganze zur Verfügung stehende Kraft widmete die Anstalt schon seit geraumer Zeit einer Beantwortung der von der Stiftung „von Schnyder von Wartensee" im Laufe des Dezenniums wiederholt ausgeschriebenen Preisaufgabe: „Das Klima der Schweiz, zu bearbeiten auf Grundlage der 37jährigen Beobachtungen der schweizerischen meteorologischen Stationen, sowie älterer Beobachtungsreihen", und die unterzeichnete Direktion hatte auch die Genugtuung, von der Stiftungskommission unterm 8. Juli a. c. die Mitteilung zu erhalten, dass ihre in Gemeinschaft mit den Herren Assistent Dr. Billwiller und Dr. Clemens Hess, Frauenfeld, unter dem 31. März des Jahres eingereichte Lösung der Preisaufgabe durch die Jury, bestehend aus den Herren: Professor Dr. Hagenbach-Bischoff in Basel, Professor Dr. H. Dufour in Lausanne und Professor Dr. Früh in Zürich, in wohlwollendster Weise begutachtet und mit dem vollen Preise gekrönt worden sei. Die Anstalt hat sich damit einer schon seit Jahren von der Oeffentlichkeit dringend verlangten Arbeit entledigt, die nun hoffentlich als Grundlage für die weitere klimatische Erforschung unseres so reich gegliederten Alpenlandes ihre guten Früchte bringen wird. Für die Publikation der Arbeit, die auf Kosten obgenannter Stiftung geschieht, wurde seitens der meteorologischen Kommission noch im laufenden Jahr ein Bundesbeitrag erwirkt.

Dank dem Entgegenkommen des Vorstandes der Drachenstation in Friedrichshafen einerseits, der schweizerischen Telegraphenverwaltung andererseits, gelangt die Anstalt seit Oktober 1908 in den Besitz eines Résumés der täglich von ersterem Institute ausgeführten Fesselballon- und Drachenaufstiege über dem Bodensee, das in Form eines kurzen chiffrierten Telegramms bis Nachmittags der Centralanstalt übermittelt wird, so dass letztere täglich über die wichtigsten Vorkommnisse in den untern Schichten der Athmosphäre unterrichtet ist.

Zufolge des letztjährigen Beschlusses der meteorologischen Kommission ist die Zentralanstalt zu der internationalen Vereinigung für wissenschaftliche Luftschiffahrt noch im gleichen Verhältnis wie bis anhin geblieben; sie beschränkte im Berichtsjahre ihre Beteiligung an allen monatlichen Terminaufstiegen, um die verfügbaren Mittel namentlich auf die grössern Serienaufstiege von Anfang April, Ende Juli und Anfang Oktober (je mit Regiestrierballons) zusammenzuhalten. Ausserdem wurden so oft als möglich Pilotballonaufstiege für spezielle Zwecke des Wetterdienstes gemacht. Die aus den verschiedenen Registrier- und Pilotaufstiegen erhaltenen Resultate sind wie gewohnt den im Anhange publizierten ergänzenden Beobachtungen beigefügt.

Die täglichen Niederschlagsmessungen sämtlicher Stationen werden in der schon früher mehrfach erwähnten Separatpublikation („Ergebnisse der täglichen Niederschlagsmessungen auf den meteorologischen- und Regenmess-Stationen") in regelmässiger Weise weitergeführt.

Die Direktion der Schweizerischen Meteorologischen Centralanstalt:

Dr. **J. Maurer.**

Tägliche Beobachtungen

der Stationen:

Bern, Neuenburg, Genf, Altdorf, Zürich, Rigi-Kulm, Sils-Maria, Castasegna, Lugano, Basel, Säntis und St. Gotthard.

im Jahre 1908.

Für die Bezeichnung der Hydrometeore und anderer Phanomene werden nach dem Vorschlag des internationalen Meteorologen-Congresses (Wien 1873) folgende Symbole angewandt:

● = Regen.	⌓ = Tau.	⍁ = Gewitter.	◑ = Sonnenhof.
✳ = Schnee.	⌴ = Reif.	⍁ = Blitz, Wetterleuchten.	⊕ = Sonnenring.
△ = Graupeln, Riesel.	⋁ = Duft.	⍀ = Nordlicht.	☾ = Mondhof.
▲ = Hagel.	⍒ = Glatteis.	⍀ = starker Wind.	☽ = Mondring.
← = Eisnadeln.	≡ = Nebel.	⍭ = Schneegestöber.	◠ = Regenbogen.

Das Zeichen ⊠ bedeutet, dass mehr als die Hälfte der Bodenfläche in der Umgebung der Station an dem betreffenden Tag mit Schnee bedeckt war.

Die Intensität der einzelnen Erscheinungen wird durch eine dem Symbol als Exponent beigefügte ° als schwach, durch ² als stark bezeichnet.

a bedeutet: Vormittags (ante meridiem), p: Nachmittags (post m.), n: Nachts.

Die römischen Ziffern geben an, dass das betr. Phänomen um die Zeit des ersten, resp. zweiten, resp. dritten Beobachtungstermins stattgefunden hat, die arabischen bezeichnen die bürgerlichen Zeitstunden, das Zeichen * interpolierte Daten.

NB. Alle Zeitangaben mit Ausnahme derjenigen in Anhang Nr. 3, 6 und 7 beziehen sich auf mittlere Berner-Zeit, resp. auf die Ortszeit des Meridians von $7^1/_2{}^0$ östl. von Greenwich.

$\lambda = 7^\circ 26'$, $\beta = 46^\circ 57'$,
$H = 572.2^m$, $G = 0.05\,{}^m/_m$.

Bern.

Monats- und Jahresübersichten

sämtlicher schweiz. meteorologischen Stationen.

In die hier folgenden Uebersichten werden die Beobachtungsresultate aller schweizerischen Stationen, soweit es die Zuverlässigkeit und Vollständigkeit derselben gestattet, aufgenommen.

Das Schema ist dem vom ersten internationalen Meteorologenkongress aufgestellten möglichst angepasst.

Zu beachten ist:

1. Die Minima und Maxima bei Luftdruck und Temperatur sind stets den üblichen Terminbeobachtungen entnommen (7^h 1^h 9^h, resp. 7^h 1^h 8^h).
2. Die Monatsmittel der Temperatur werden aus den 3 Terminbeobachtungen in der Weise abgeleitet, dass der Abendbeobachtung (9^h) das doppelte Gewicht beigelegt ist ($m = 1/4 (7 + 1 + 2 . 9)$). Bei den wenigen Stationen, die eine andere Kombination der Beobachtungsstunden haben, wird die entsprechende Reduktion nach den stündlichen Werten von Bern u. Säntis angebracht.
3. Zu den Tagen mit Niederschlag werden alle gezählt, an denen derselbe den Betrag von wenigstens 0.3^{mm} erreicht sei dies nun Regen oder Schnee, oder beides zugleich.
   Eine zweite Rubrik enthält die Zahl der Tage mit Niederschlagsmengen von mindestens 1.0^{mm}.
4. Tage mit mehreren Gewittern werden nur einfach gezählt.
5. Als heitere Tage werden solche bezeichnet, deren mittlere Bewölkung $\leqq 2.$
   » trübe » » » » » » » $\geqq 8.$
6. Bei der Uebersicht der Windverteilung wird nur die Häufigkeit der verschiedenen Windrichtungen mit Intensität > 0 berücksichtigt.
7. λ bezeichnet die geographische Länge in Graden von Greenwich, β die geographische Breite, H die Höhe des Stationsbarometers über dem Meer in Metern, G ist die Korrektion, welche an den Luftdruckdaten für deren Reduktion auf die Normalschwere (45° Breite und das Meeresniveau) noch anzubringen ist, h die Höhe des oberen Randes des Regenmessers über dem Erdboden. Die Stationen, bei denen die Höhe (der Barometercüvette) bis auf den Dezimeter angegeben ist, sind an das schweizerische Präzisionsnivellement angeschlossen. Alle Höhen sind auf Pierre du Niton 373.6^m bezogen.

Zürich.

$\lambda = 8°33'$, $\beta = 47°23'$, $H = 493.2^{m}$, $G = 0.08\ ^{m}/_{m}$, $h = 1.4^{m}$

*) Auf der Station Neuchâtel wurde erst nach Drucklegung der Monatstabellen vorliegenden Jahrgangs erruiert, dass durch Verstellung der Skala das Barometer seit September 1907 zu tief zeigte. Die Untersuchung ergab, dass an den in den Monatstabellen pag. 1. 7. etc. publizierten Standen noch eine Korrektion von — 1.2 $^m/_m$ anzubringen ist. Daraus erklärt sich die Verschiedenheit der Daten in der Jahresübersicht mit denjenigen in den Monatstabellen.

Anhang

zum Jahrgang 1908 der

Annalen der schweizerischen meteorologischen Centralanstalt.

Ergänzende Beobachtungen und

Abhandlungen.

Nr. 1.

Ergebnisse der Niederschlagsmessungen auf den meteor. Stationen I.–III. Ordnung im Jahre 1908.

Die Änderungen im Netze der Meteorologischen und Regenmesstationen finden sich in der Einleitung Pag. IV dieses Bandes angegeben.

Monats- und Jahressummen

der Niederschlagsmessungen sämtlicher meteor. Stationen I.—III. Ordnung

im Jahre 1908.

Bei Zählung der Niederschlagstage sind in dieser Tabelle nur die Tage mit mindestens 1,0 mm berücksichtigt worden.
Die mit * bezeichneten Summen sind nach den Nachbarstationen interpoliert.

Riggenbach «reduzierten» Messungen benützt. — [6]) Glarus: 37-jährige Mittel; die Jahre 1868—1870 sind interpoliert. — [7]) Rigi-Kulm: Mittel der 20 Jahre 1881—1900. — [8]) Luzern: Mittel aus den Beobachtungen an der Station Musegg aus den Jahren 1881—1900, reduziert auf die 40-jährige Periode 1861—1900 nach den Beobachtungen im Kantonsschulgebäude. — [9]) Guttannen: Mittel der Jahre 1877—1900 reduziert auf die 37-jährige Periode nach den Daten von Beatenberg. — [10]) Reckingen: Mittel der 20 Jahre 1881—1900 reduziert auf die 37-jährige Periode nach den Daten von Sion. — [11]) Clarens: Mittel der 30 Jahre: (1864—1875) + (1883—1900). — [12]) Lausanne: Mittel der 27 Jahre 1874—1900 auf die 37-jährige Periode reduziert nach den Daten von Genf.

Im Berichtjahre darf ein besonderes Interesse beanspruchen

Der Schneefall anlässlich des Wettersturzes vom 22.—24. Mai.

Schneefälle im schweizerischen Mittelland zur Zeit der vollen Belaubung der Bäume gehören glücklicherweise zu solchen Seltenheiten, dass deren Daten nicht nur den Meteorologen im Gedächtnis bleiben. Denn in der Regel ist es nicht nur der auffallende Kontrast zwischen vorgeschrittener Vegetation und Rückfall zu winterlichem Wetter, der solche Fälle denkwürdig macht, sondern der dabei in Kulturen und Wäldern angerichtete Schaden. Die spätesten Schneefälle seit der Existenz unseres Beobachtungsnetzes (1864) waren diejenigen vom *24. Mai 1867* und vom *15. Mai 1885,* von denen der letztere in der Ostschweiz Schaden brachte. Eine eigentliche Katastrophe aber verursachte der am *28. September* desselben Jahres (1885) auftretende ausserordentlich starke Schneefall in der Nord-, Ost- und Zentralschweiz durch enormen Schaden an Obstbäumen, in Weinbergen und Gärten, namentlich aber in den Laubholzwaldungen.*) Die Wetterlage war in den beiden letzten Fällen die nämliche: eine über dem SW des Kontinentes erschienene Depression pflanzte sich östlich nach Oberitalien und dann nordöstlich nach Ungarn fort (Zugstrasse 5 b nach Bebber); auf deren Rückseite stellten sich über Zentraleuropa kalte Nordwestwinde ein, welche die Temperatur so erniedrigten, dass die Niederschläge schliesslich auch im Mittelland in Schnee übergingen. In beiden Fällen ging dem Schneefall eine mehrere Tage umfassende Periode sehr kühlen Wetters voraus.

Ganz anders war die Wetterfolge bei dem späten Schneefall des Berichtsjahres. Ein Hochdruckgebiet lagerte zu Ende der zweiten Dekade des Mai über dem westlichen und zentralen Europa; bei voller Insolation war die Temperatur im schweizerischen Mittellande bis zu 6° über die normale gestiegen und nahm am 21. auf der Alpennordseite noch mehr zu, als sich der höchste Druck nach dem östlichen Mitteleuropa verlagert und eine nordwestliche Depression ein Teilminimum über dem Kanal entwickelt hatte. Entsprechend dieser Druckverteilung setzte im Verlaufe des 21. Mai in den Alpentälern Föhn ein, wie nicht nur aus den Beobachtungen der alpinen Stationen, sondern auch aus den in Anhang No. 6 dieses Bandes mitgeteilten Pilotballonvisierungen in Zürich hervorgeht; die Visierung vom Nachmittag des 21. lässt in dem Südwind der Schicht von 1500—2500 m den Föhn deutlich erkennen. Auch in der Nacht vom 21./22. und am 22. hielt letzterer an; nach der beigedruckten Wetterkarte vom 22. ist an diesem Tage die vortags über dem Kanal gelegene Teildepression bis zum Skagerrak fortgeschritten und eine zweite über dem mittleren England zu erkennen; von dem nordwestlichen Depressionsgebiet erstreckt sich eine Furche niedrigen Druckes quer durch Zentraleuropa nach dem Mittelmeer. Im äussersten Westen (über Irland und Westfrankreich) haben die Winde nach NW zurückgedreht und in Frankreich ist nach vorausgegangenen Gewittern die Temperatur stark gesunken, am meisten — ca. 10° gegenüber dem Vortage — in einer zwischen Brüssel und Paris gelegenen Zone. Im Verlaufe des 22. traten nun auch weiter ostwärts Gewitter auf, so am Nachmittag, streckenweise von schwerem Hagelschlag begleitet, in der oberrheinischen Tiefebene. Dagegen kamen in der Schweiz — abgesehen von einigen ganz lokalen Gewitterzügen — keine Gewitter zum Ausbruch; der in den Alpentälern wehende Föhn machte sich um den Mittag weit ins Mittelland hinaus bemerkbar; Zürich hatte kräftigen Südost von 12 m pro Sekunde mittlerer Geschwindigkeit; Temperatur um 1½ p 27.6° bei 29% relativer Feuchtigkeit. Die Pilotvisierung von 2¼ p wies die Existenz dieser südlichen Luftströmung von durchschnittlich ca. 10 m Geschwindigkeit bis zum höchsten erreichten Punkt (4000 m) nach; ein nahezu gleichzeitiger Drachenaufstieg der Drachenstation Friedrichshafen gibt für Temperatur und relative Feuchtigkeit folgende interessante Werte, denen gleich die entsprechenden Zahlen des nächstfolgenden Tages angeschlossen werden sollen.**)

22. Mai 1908								23. Mai 1908		
1.06 p	395 m	22.7°	50%	1.06 p	1500 m	16.9°	36%	7 a	7.8°	92%
	500 m	25.2°	30		2000 m	12.7°	50		5.6°	97
	1000 m	21.7°	31	1.55 p	2120 m	11.9°	56		1.6°	100

Bemerkenswert ist, wie ausgesprochen über dem Bodensee — also in relativ grosser Entfernung vom Alpenkamm — der Föhncharakter der südlichen Luftströmung noch auftritt (Temperaturabnahme zwischen 1000 und 2000 m 0.90° pro 100 m).

*) Vergl. J. Coaz, Der Schneeschaden vom 28./29. Sept. 1885 in den Waldungen der Schweiz. Bern 1887.
**) Vergl. Deutsches Meteor. Jahrbuch 1908, Württemberg, Anhang II, Die Drachenstation am Bodensee.

Zufolge dieser Föhnströmung erreichten die Temperaturen am 22. trotz zunehmender Trübung wenigstens in der Ostschweiz wieder einen für die Jahreszeit sehr hohen Stand (Zürich 1 p*) 27.6°, Maximum 28.5°). Dann trat am Nachmittag eine plötzliche intensive Abkühlung ein; über deren zeitlichen Verlauf und Betrag mögen die folgenden Zahlen aus der Zürcher Registrierkurve orientieren:

22. Mai 1908						23. Mai 1908			
3h45 p	4h	6h	8h	10h	12h	2ha	4h	6h	7h
27.9°	20.0	16.3	12.6	10.0	7.8	6.2	5.1	4.2	4.0

Dieser Temperatursturz ist jedenfalls einer der grössten und am raschesten verlaufenden Temperaturschwankungen — Änderung 24° in 14 Stunden — die in unserem Klima vorkommen. Sein Beginn (3h 45 p) fällt zusammen mit einer plötzlichen Drehung des Windes von SSE nach WNW; der Übergang muss nach dem Diagramm der Windrichtung ein ganz unvermittelter gewesen sein; Geschwindigkeit des NW im Mittel ca. 5 m per Sekunde; in der Nacht flaut er ab.

Interessant ist es nun, an Hand einer nach 5 p in Zürich ausgeführten Pilotvisierung sowie der Beobachtungen der Bergstationen konstatieren zu können, dass die kalte nordwestliche Luftströmung sich zunächst auf die untersten, bodennahen Schichten beschränkte und nur allmählig emporschwoll. Nach der erwähnten Visierung reichte sie zwischen 5 u. 5½ p bis zur Höhe von 1200 m (vergl. Anhang No. 7); darüber hinaus bestand die südliche Strömung mit gegenüber dem Mittag wenig veränderter Intensität fort. Zur Zeit der Abendbeobachtung (9 p) muss der NW das Niveau der Voralpengipfel Rigi und Pilatus erreicht haben. Aus den Temperaturen dieser Stationen — die nebst denjenigen anderer freigelegenen Bergstationen aus folgender kleinen Tabelle ersichtlich sind — würde dies allerdings nicht mit Sicherheit hervorgehen:

	22. Mai 1808				23. Mai 1908			
	7a	1p	9p	M	7a	1p	9p	M
495 m Zürich	19.8	27.6	11.0	19.5	4.0	5.6	0.4	3.3
900 m Albishorn . .	19.4	22.6	9.0	17.0	3.4	3.0	0.0	2.1
1285 m Weissenstein .	16.6	20.2	3.2	13.3	−1.8	−1.0	−1.0	−1.3
1787 m Rigi-Kulm . .	12.1	16.2	7.6	12.0	−1.8	−0.2	−3.6	−1.9
2068 m Pilatus	9.6	12.4	7.0	9.7	−1.0	−0.6	−4.0	−1.9
2500 m Säntis	6.6	8.5	3.3	6.1	−2.4	−1.4	−6.4	−3.4
2964 m Zugspitze . . .	4.0	5.3	1.4	3.6	−0.3	0.0	−2.4	−0.9
3106 m Sonnblick . .	2.4	3.8	0.0	2.1	−0.6	0.0	−0.8	−0.5

Namentlich hat Pilatus noch eine relativ hohe Temperatur (7.0° gegenüber 12.4° um Mittag); auf die Windbeobachtungen des Pilatus darf man wegen dafür ganz ungeeigneter Lage der Station nicht abstellen. Dagegen spricht dafür die Hygrometerbeobachtung dieser Stationen, welche 100% relative Feuchtigkeit anzeigt (gegenüber 8% auf der Rigi um Mittag!); beweisend aber sind ihre Barometerbeobachtungen in Verbindung mit denjenigen von Zürich und Säntis.

Anmerkung. In Zürich war der Luftdruck am 22. bis zum Zeitpunkt der Winddrehung nach NW gefallen (Minimum 712.8 m/m), von da an haben wir ununterbrochenes Steigen entsprechend dem Emporwachsen der kalten Luftströmung. Nehmen wir an — und wir haben, wie wir sehen werden, dafür Anhaltspunkte — dass das Säntisniveau (2500 m) ungefähr die obere Grenze gewesen sei, bis zu welcher sich die kalte Luft in der Folge emporgearbeitet hat, so geben uns die Barometerbeobachtungen des Säntis den von der Kälteinvasion nicht beeinflussten Gang des Luftdrucks, der sich nach dem Barogramm als in fortdauernder Abnahme begriffen darstellt.

Gang des Barometers in verschiedenen Höhenlagen:

	22. Mai		23. Mai		
	1p	9p	7a	1p	9p
493 m Zürich	714.0	16.7	20.1	20.0	20.1
1285 m Weissenstein . .	651 1	51.8	52.4	52.8	51.4
1787 m Rigi	614.2	13.1	13.1	12.8	12.8
2068 m Pilatus	593.5	92.5	91.9	91.5	90.9
2500 m Säntis	564.4	62.4	60.8	59.9	59.2
2964 m Zugspitze . . .	533.6	32.0	30.1	28.8	27.7
3106 m Sonnblick . . .	524.9	23.4	21.6	21.5	20.3

*) Ortszeit.

Das Steigen des Barometers in Zürich gibt somit nicht den ganzen Betrag des durch Kälterwerden der Luftsäule bedingten Druckanstieges; die ganze thermische Drucksteigerung erhalten wir, wenn wir zu dem Betrag, um welchen der Barometer in Zürich gestiegen ist, noch denjenigen hinzufügen, um welchen er auf dem Säntis gefallen ist (letzterer Betrag reduziert auf das Niveau von Zürich), also falls wir von den Terminbeobachtungen 1 p des 22. und 7 a des 23. ausgehen: Steigen in Zürich 6.1 $^{m}/_{m}$ + Fallen auf dem Säntis (reduziert auf Niveau Zürich) 4.6 $^{m}/_{m}$ = 10.7 $^{m}/_{m}$ thermisch bedingter Druckanstieg in Zürich. Die zwischen Zürich und Säntis gelegenen Stationen verhalten sich folgendermassen: Um 9 p hat der Luftdruck auf dem Weissenstein gegenüber dem Mittag zugenommen, d. h. die kalte Schicht ist über das Niveau von 1285 m emporgeschwollen; auf Rigi und Pilatus hat der Luftdruck zwar abgenommen, aber nur um ca. die Hälfte des Betrages auf dem Säntis, d. h. die kalte Schicht reicht auch über das Niveau dieser Stationen hinauf und das Kälterwerden der darüber liegenden (aber nicht bis zum Säntisniveau reichenden) Schicht kompensiert teilweise das — vom Säntis angezeigte — Fallen des Luftdruckes.

Nicht scharf festzustellen ist der Zeitpunkt, zu welchem die kalte Luft das Säntisniveau erreicht, trotz der vorliegenden Registrierkurven von Windrichtung und Temperatur (vergl. Anhang No. 2). Hier dreht der Wind unter fortwährendem Temperaturrückgang in der Nacht vom 22./23. über SE, E (von 5 a des 23. an), NE (von 10 a) nach N (von 9 p). Viel höher als das Säntisniveau kann die nördliche Luftströmung nicht emporgedrungen sein: Zugspitze und der (allerdings schon weiter östlich gelegene) Sonnblickgipfel, welche die mit solchen Abkühlungen auftretenden Drehungen des Windes von SW nach NW und N mit viel grösserer Sicherheit als Säntis anzeigen*), haben in diesen Tagen keine nördlichen Winde. Letztere erreichen also die Kammhöhe der Alpen nicht und die kalte Luft tritt nicht über auf die Südseite der Alpen. Das geht auch hervor aus den meteorologischen Verhältnissen des Südhanges am 23., wo alles gegen das Vorhandensein von Fallwinden spricht: die kleine vertikale Temperaturabnahme (Differenz Castasegna–Sils 5.9°), der Südostwind auf dem Monte Generoso und die starken Niederschläge (Tagessumme des 23. in Lugano 125 $^{m}/_{m}$). Vielmehr scheint der Südfuss unter dem Einfluss einer auf der Wetterkarte vom 23. erkenntlichen Teildepression (Golf von Genua) zu stehen.

Diese Wetterkarte zeigt uns die nördliche Depression ostwärts bis nach Nordskandinavien fortgeschritten, ein Ausläufer liegt über dem östlichen Deutschland. Die ausgedehnten Gewitter über Zentraleuropa am Vortage und die ihnen folgenden, sich böenartig von unten nach oben ausbreitenden nördlichen Winde sind in Verbindung zu bringen mit dem Vorübergang dieses wohlausgebildeten Teilwirbels; man betrachte den Verlauf der Isothermen am 23. (8 a) über Zentraleuropa: Die Isotherme von 15°, die am Vortage ganz Mitteleuropa umfasste, ist ostwärts zurückgewichen bis zirka zum 15. Längengrad, auf welchem das Zentrum des Wirbels zu dieser Stunde liegt, und am Nordfuss der Alpen, wohin vor 24 Stunden unter dem Einfluss des Föhn die 20° Isotherme vorgedrungen war, finden wir jetzt über dem schweizerischen Mittellande eine 5° Isotherme! Dass unter solchen Umständen die seit nachts (22./23.) eingetretenen Niederschläge in den Alpen als Schnee fallen, hat nichts aussergewöhnliches, auch wenn wir wissen, dass die Temperaturabnahme nach oben eine sehr langsame ist; die Höhenlage der Nullgradisotherme in der freien Atmosphäre muss nach dem Drachenaufstieg von Friedrichshafen von morgens 7^{h} in ca. 1200 m gewesen sein. Schneefall vor der Morgenbeobachtung (7 a) des 23. melden die Höhen und Hochflächen des Jura, Rigi, Pilatus und Andermatt; zur Zeit der Morgenbeobachtung oder kurz nachher schneit es in den Alpentälern bis gegen 1000 m herunter (Heiligenschwendi, Engelberg, Göschenen). Wenn wir die am weitesten nach Westen und Osten vorgeschobenen Landesteile vergleichen, so lässt sich deutlich das zeitliche Fortschreiten von Westen nach Osten erkennen: im Jura schneit es schon in der Nacht vom 22. 23., 8½ a sogar in Genf (wobei gleich bemerkt sei, dass der Schnee an den Uferstrichen des Leman nicht liegen blieb); in den bündnerischen Hochtälern (Arosa, Davos) andererseits setzte erst 3 p Schneefall ein. Zieht man aber diese durch das Fortschreiten des Wirbels bedingten Zeitdifferenzen zwischen Westen und Osten in Berücksichtigung, so tritt in selten so schön zu verfolgender Weise das Vordringen des Schneefalls vom Alpenkamm gegen die Voralpen und später gegen das Mittelland zu tage, denn der Schneefall bedeutete, je tiefer wir kommen, ein um so aussergewöhnlicheres Ereignis, von welchem dementsprechend eine ungewöhnlich grosse Anzahl von Angaben über Eintritt, Dauer und Intensität vorliegen. Eine Kartierung der Eintrittszeiten besagt, dass das bernerische Mittelland ca. um 2 p, das Gebiet des Zürichsees ca. um 7 p Schneefall hatte; zur Zeit der Abendbeobachtung (9 p) ist nur im äussersten Nordosten des Landes (Sohle des Rheintals von Chur an abwärts, Bodensee- und das nordwärts der Thur gelegene Gebiet) der Regen noch nicht in Schnee übergegangen.

*) Vergl. H. v. Ficker: Der Transport kalter Luftmassen über die Zentralalpen. Denkschr. der math.-naturw. Klasse der K. Akademie der Wissenschaften, Band LXXX, Wien 1906.

Höhe der am 23. Mai 1908 gefallenen Schneedecke in cm.

Am Morgen des 24. Mai präsentierte sich dem erstaunten Auge eine vollständige Winterlandschaft. Es wurde versucht, die zahlreichen Angaben über die Höhe der Schneedecke auf der Karte darzustellen; dass dies notwendigerweise in zusammenfassender Weise geschehen müsste, namentlich bei dem kleinen Masstab der beigedruckten Reproduktion, ist selbstverständlich.

Unter Weglassung aller Details dürfte das Kärtchen ein richtiges Bild über die mittlere Höhe der abnorm späten Schneedecke in den einzelnen Landesgegenden geben, wenigstens soweit die Zentralanstalt in den Besitz von Messungen gekommen ist. Auf eine Fehlerquelle bei diesen Messungen, welche verschiedene zu grosse Schneehöhenangaben erklärt, soll hier beiläufig aufmerksam gemacht werden: wo die Dicke der Schneeschicht auf Wiesen gemessen wurde, achtete man vielfach nicht darauf, dass damit nicht nur die Höhe der Schneeschicht, sondern auch die darunter liegende, allerdings stark zusammengepresste Grasschicht gemessen wurde.

Über die mannigfachen schweren Schädigungen, die der Schnee in Wiesen, Getreidefeldern, an Obstbäumen, in Gärten und Alleen und in den Laubholzwaldungen anrichtete, berichteten die Tageszeitungen einlässlich. Um dieselben zu verstehen, muss man nicht nur die Schneehöhe, sondern die Schwere dieses Schnees, der sehr allmählig von Regen in die feste Form überging, berücksichtigen. Anhaltspunkte dafür geben uns die Ombrometerangaben von Zürich, nach welchen von der Tagessumme von 36.1 m/m vom 23. Mai 12.1 m/m auf den Regen und den mit Regen vermischten Schnee bis abends 9 h fallen, 24.0 m/m auf den Schneefall während der Nacht des 23./24.; diesen 24.0 m/m Schmelzwasser entspricht eine Schneehöhe von nur wenig mehr als 10 m. In höheren Lagen fiel der Schnee trockener; dieser Umstand, sowie die Tatsache, dass die Vegetation dort noch nicht so weit fortgeschritten war, erklären es, warum in höheren Lagen trotz der grösseren Schneemengen weniger Schaden eintrat. In einem instruktiven Artikel in der schweizerischen Forstzeitung (1908), betitelt „Der Schneefall vom 23. 24. Mai 1908 und dessen Folgen für unsere Waldungen", betont Ph. Flury, Adjunkt der forstl. Versuchsanstalt, dass unter dem ersten Eindruck der Schaden vielfach überschätzt wurde, „indem die nachfolgende günstige Witterung und die pflanzliche Reproduktionskraft manchen Schaden ausheilten oder vermindern halfen". Ganz richtig wird in diesem Artikel auch darauf hingewiesen, dass dem Lande eine eigentliche Katastrophe erspart blieb durch die ausserordentlich günstige Wetterfolge, wie sie sich vom 24. an einstellte. Während sich nämlich die südliche Teildepression auszufüllen begann, erschien über den britischen Inseln ein neues Tiefdruckgebiet, das in Wechselwirkung mit dem im Südwesten liegenden höheren Druck südwestliche Winde und damit langsame Erwärmung (und Regen) verursachte, welche den Schnee zum Schmelzen brachte. Ein rascher Vorstoss von hohem Druck aus Westen hätte dagegen Luftzufuhr aus Norden und Aufheiterung und damit unfehlbar Frost gebracht; lagen doch die Temperaturen in der Nacht und am Morgen des 24. bei bedecktem Himmel im Mittelland nur wenige Zehntel über Null Grad.

Schliesslich muss noch mit wenigen Worten darauf eingegangen werden, warum die Schneefälle bei diesem Wettersturz sich auf unser Land beschränkt haben; die Nordwestwinde, welche auf der Rückseite des im Verlaufe des 22. über Zentraleuropa fortschreitenden Teilwirbels einströmten, brachte ja nicht nur dem schweizerischen Alpenvorlande, sondern ganz Zentraleuropa einen starken Temperaturrückgang und da kann man sich fragen, warum es z. B. auf der rauhen bayerischen Hochebene nicht schneite. — Wie schon aus der auf wenigen Zahlen basierenden Niederschlagskarte des Seewartewetterberichtes hervorgeht, waren die in der Nacht vom 22. einsetzenden Niederschläge weitaus am intensivsten im schweizerischen Alpengebiete und dessen Vorlande und nahmen nach Osten rasch an Intensität ab; diese Niederschläge fielen in den Alpen bis relativ weit herunter als Schnee. Diese ausgebreiteten und intensiven Schneefälle mussten aber in der Folge die ohnehin schon tiefe Temperatur im schweizerischen Voralpenlande lokal noch mehr erniedrigen, so dass auch hier der Niederschlag im Laufe des 23. in Schnee überging. Diese Annahme erhält eine Stütze durch die beträchtliche Temperaturdifferenz, welche sich für den Abend des 23. zwischen schweizerischem Mittelland (Zürich 0°) und der bayerischen Hochebene (München 7°) nachweisen lässt.

Dr. Robert Billwiller.

No. 2.

Resultate der Aufzeichnungen der autographischen Apparate für Luftdruck, Temperatur, Richtung und Geschwindigkeit des Windes

auf den Stationen: Zürich, Säntis und Bern

im Jahre 1908.

In den nachfolgenden Tabellen folgen die stündlichen Werte einiger meteorologischen Elemente für Zürich und Säntis in extenso, für Bern nur in Monatsmitteln. — In Zürich und auf dem Säntis werden die Temperaturen durch Richard'sche Thermographen, die Daten für Luftdruck durch Sprung-Fuess'sche Barographen, die Aufzeichnungen der Windrichtung und Windgeschwindigkeit durch Anemographen von Beckley gewonnen. — In Bern wird seit Anfang 1898 die Registrierung der Temperatur und Feuchtigkeit in veränderter Exposition, nämlich in einer freistehenden Hütte und mit Verwendung des Richard'schen Thermo- und Hygrographen, vorgenommen; die Luftdruckbeobachtungen dagegen werden wie bisher vom Wild-Hasler'schen Barographen gewonnen.

Januar 1908. Stündliche Lufttemperaturen. Zürich.

Nr. 3.

Gewitterbeobachtungen im Jahre 1908.

(Mit 4 Tafeln.)

Die Gewitterbeobachtungen wurden in gewohnter Weise fortgesetzt und vom bisherigen Bearbeiter zusammengestellt. Die Gesamtzahl der eingegangenen Gewitterrapportkarten variiert bei den einzelnen Stationen sehr beträchtlich und es beschränken manche Beobachter, die keine Karten einsenden, auch die Gewitternotizen in den Tabellen auf ein Minimum, weist doch ein erheblicher Prozentsatz der Tabellen meteorologischer und Regenmess-Stationen keine diesbezüglichen Angaben auf. Zur Vervollständigung des aus den Gewitterkarten und den Tabellen gewonnenen Materials ist, wie früher, das Verzeichnis der von Hagel betroffenen Gemeinden, sowie eine Anzahl zuverlässiger Zeitungsberichte benutzt worden. Das nachstehende Verzeichnis gibt, alphabetisch nach Kantonen und nach dem Wohnsitz geordnet, die Namen derjenigen HH. Beobachter, welche durch Einsendung von entsprechend ausgefüllten Gewitterkarten, eventuell auch durch briefliche Mitteilung über eine grössere Anzahl von Gewittern speziell berichtet oder die betreffenden Aufzeichnungen in den Monatstabellen durch genaue Zeitangaben verwertbar gemacht haben.

1. Kanton Aargau.

Aarau — H. Amsler, Werkführer.
Baden — J. Hitz, Parkaufseher im Kasino.
Böttstein — Joh. Hauser, Mech. Stickerei.
Kölliken — J. Haller, Pfarrer.
Möhlin — X. Stocker, Pfarrer.
Muri — Gebr. Ruepp, Handlung.
Rheinfelden — Frau A. Hoffmann.
Unter-Kulm — Dr. med. Stähli.
Wittnau — L. Weber, Pfarrer.
Zofingen — J. U. Brack, Lehrer.
Zurzach — J. Eichenberger, Lehrer.

2. Kanton Appenzell.

Appenzell — E. Lehner, Reallehrer.
Heiden — J. J. Niederer, Lehrer.
Säntis — J. Bommer.
Schwäbrig — Valentin Lori, Verwalter.
Teufen — J. Tanner, Lehrer.

3. Kanton Basel.

Augst — C. Tanner, Vorsteher.
Basel — Prof. Dr. A. Riggenbach, W. Strub, Assistent und Walter Mörikofer.
Binningen — Wilhelm Denz, Pfarrer.
Buus — W. Bührer, Pfarrer.
Diegten — H. Bay, Pfarrer.
Eptingen — A. Madörin, Lehrer.
Gelterkinden — E. Denger-Rudolf, Kaufmann.
Kilchberg — E. Buess, Landwirt.
Lampenberg — Emil Vögelin.
Langenbruck — Traugott Bieder, Sigrist.
Liestal — L. Leuthardt, Aufseher.
Neue-Welt — J. J. Schmassmann, Lehrer.
Pfeffingen — Mathias Tschudy, Lehrer.
Therwil — Adolf Stehlin, Bezirkslehrer.

4. Kanton Bern.

Aarberg — E. Krebs, Sekundarlehrer.
Beatenberg — G. Buchmüller, Pfarrer.
Bellelay — César Winkelmann, Portier.
Bern — Tellur. Observatorium.
Biel — Ed. Wartmann, Apotheker.
Champ-Fahy-sur-Neuveville — Louis Grosjean, instituteur.
Choindez — H. Weisskopf, Gärtner.
Delémont — H. Gobat, inspecteur scolaire.
Grosshöchstetten — E. Borel-Wanzenried, Lehrerin.
Gsteig b. Saanen — Hans Müller, Pfarrer.
Guttannen — K. Fischer, Gemeindeschreiber.
Heiligenschwendi — Sanatorium.
Herzogenbuchsee — Bertha Moser, Part.
Langnau — J. U. Zbinden, Sekundarlehrer.
Lyss — Fritz Bürgi, Coiffeur.
Lauterbrunnen — Fr. Gammeter, Sekundarlehrer.
Mervelier — Albin Marquis.
Mormont — Alfred Bietry, cultivateur.
Saignelégier — Alfred Fleury, pharmacien.
St-Imier — C. Mœschler, instituteur.
Tramelan — J. Herzog, pasteur.
Wimmis — Fr. Klopfenstein, Sekundarlehrer.
Zweisimmen — D. Gempeler-Schletti, alt Sekundarlehrer.

5. Kanton Freiburg.

Freiburg — Dr. A. Gockel.
Marsens — Amédée Charrière, concierge.
Murten — Sam. Müller, Gutsverwalter.
La Valsainte — A. Villard, chartreux.

6. Kanton St. Gallen.

Altstätten — Johannes Haltner, Lehrer.
Haag — Gg. Pedolin, Zolleinnehmer.
St. Gallen — J. G. Kessler, Bankbeamter.
Sargans — Jos. Anton Albrecht, Schreiner.
Wildhaus — Johannes Näf, Landwirt.

7. Kanton Genf.

Genf — Observatorium.

8. Kanton Glarus.

Elm — J. Weiss, Lehrer.
Glarus — J. Gehring, Waisenvater.
Obstalden — Peter Felix, Pfarrer.

9. Kanton Graubünden.

Andeer — Jul. Lutta, Pfarrer.
Bernhardin — Stoffel-Bellig.
Bevers — J. Camenisch, Lehrer.
Braggio — C. Berera, Förster.
Brusio — Mich. Morosani.
Castasegna — A. Garbald, Zolleinnehmer.
Chur — C. Defila.
Davos-Platz — Hans Valär, Direktor des Kurvereins.
Grono — Christian Albin, Landjäger.
Platta-Medels — G. A. Simeon, Pfarrer.
Scewis — E. Sprecher-Jenny, Posthalterin.
Splügen — Chr. Lorez, Zolleinnehmer.
Sta Maria — Simeon Tuffli, Zolleinnehmer.
Surrhein — Ths. J. Berther, Pfarrer.
Tschiertschen — Ferd. Sprecher, Pfarrer.

10. Kanton Luzern.

Entlebuch — Hans Ackermann-Vogel.
Hitzkirch — Frau Prof. Achermann-Lang.
Luzern — Nina Arnet, Lehrerin.
Münster — A. Schmid, Bez.-Lehrer.
Triengen — C. Fischer, Ger.-Schreiber.
Vitznau — E. Bärri, Arzt.
Weggis — Johannes Naef, Arzt.

11. Kanton Neuenburg.

La Brévine — J. Matthey de l'Etang, part.
La Chaux-de-Fonds — Léon Leuba, dessinateur.
Cernier — Dr. A. Jeanrenaud, professeur.
Dombresson — Paul Favre, directeur.
Les Ponts — Armand Erb, horloger.
Neuenburg — Observatorium.
St. Sulpice — Fabriques de Pâtes de bois.

12. Kanton Schaffhausen.

Lohn — Hanna Brühlmann, Posthalterin.
Schaffhausen — G. Meyer, Lehrer.
Schleitheim — J. G. Neck, Reallehrer.
Stein — J. Guhl, Apotheker.
Unter-Hallau — J. C. Gasser, Reallehrer.
Wilchingen — John Gysel, Oberlehrer.

13. Kanton Schwyz.

Altendorf — Meinrad Bruhin, Landwirt.
Einsiedeln — Pater M. Egger.
Gersau — A. Müller, Hotelier.
Küsnach — Oscar Trutmann.
Lachen — Joseph Mettler, Buchdrucker.
Oberiberg — Xaver Holdener, Gemeindeschreiber.
Rigi-Scheidegg — Emil Reese, Gärtner.
Schwyz — X. Kistler, Professor.

14. Kanton Solothurn.

Balsthal — E. Heutschi, Lehrer.
Weissenstein — K. Illi, Hotelier.

15. Kanton Tessin.

Bellinzona — Friedrich Merz, Forstinspektor.
Brissago — G. Givanelli, industriel.
Crana-Torricella — P. Petrocchi, guardiano.
Locarno — Giuseppe Mariani, Schulinspektor.
Lugano — Giovanni Belletti, Professor.
Ponte Tresa — J. Crivelli, Zolleinnehmer.

16. Kanton Thurgau.

Aadorf — Johann Nater, Lehrer.
Bischofszell — H. Fischer, Sek.-Lehrer.
Diessenhofen — J. G. Mäder, Sek.-Lehrer.
Frauenfeld — Dr. Hess, Professor.
Haidenhaus b. Steckborn — C. Herzog, Staatsförster.
Steckborn — C. Pischl-Hartmann.
Weinfelden — F. Graf, Sek.-Lehrer.

17. Kanton Unterwalden.

Engelberg — Pater Nicol. Kaeser.
Lungern — J. Renggli, Arzt.
Sarnen — H. Felderer, Professor.

18. Kanton Uri.

Altdorf — Franz Nager, Rektor.
Göschenen — Fr. Aeberhardt, Verwalter.
Isenthal — Ferdinand Aschwanden, Schreiner.

19. Kanton Waadt.

Baulmes — A. Grin.
Clarens — C. Bührer, pharmacien.
Cossonay — Paul Huber, maître secondaire.
La Cure (les Dappes) — Ad. Bernard, receveur des douanes.
Lausanne — D. Valet, concierge au Champ de l'air.
Montcherand — M. Moreillon, inspecteur-forestier.
Nyon — Th. Wellauer, conseiller municipal.
Payerne — Paul Cruchet, maître de sciences naturelles.
Les Rouges-sur-Chéserex — Bignens, forestier cantonal.
Le Sentier — Dr. Sam. Aubert, professeur.
Yverdon — Dr. P. Jomini, professeur.

20. Kanton Wallis.

Leukerbad — Schwester Hildegard.
Sierre — François de Courten, curé.
Sion — P. Aloys, capucin.

21. Kanton Zürich.

Andelfingen — Th. Gubler, Sekundarlehrer.
Dietikon — J. Knecht, Lehrer.
Dübendorf — Jakob Angst, Lehrer.
Grüningen — E. Müller, Lehrer.
Hochfelden — Konrad Keller, Aufseher.
Mettmenstetten — R. Ganz, Lehrer.
Niederhasli — H. Müller, Sekundarlehrer.
Rheinau — Pflegeanstalt.
Richterswil — Gottfried Ammann, Sekundarlehrer.
Stäfa — Traugott Hunziker, Waisenvater.
Uster — H. Weber-Schellenberg, Industrieller.
Wädenswil-Dorf — H. Baumann, Lehrer.
Wädenswil-Weinbauschule — Dr. Hofer, Lehrer für Naturk.
Wernetshausen — Ed. Benz, Lehrer.
Winterthur — Fr. Krebs, Professor.
Wil (Rafz) — D. Angst, Friedensrichter.
Zürich — Meteorolog. Centralanstalt.

22. Kanton Zug.

Cham — Xaver Roth, Badmeister.

Die Summe der zur Verfügung gestandenen Notizen, nämlich 4276, wovon 3453 aus den Tabellen der meteorologischen und Regenmess-Stationen ausgezogen, 787 den Gewitterrapportkarten und brieflichen Mitteilungen entnommen und die übrigen aus Zeitungen gewonnen sind, verteilt sich auf die 123 Tage mit Gewittererscheinungen wie folgt:

Die Zahl der Tage mit erheblichem Hagelschlag beträgt 30, die Summe der betroffenen Gemeinden 1100, welche sich auf 295 Bezirke verteilen. Ferner wurde Hagel konstatiert in drei Gemeinden des Kantons Tessin am 11. September; in zwei Gemeinden des Kantons Bern und je einer der Kantone Neuenburg und Schaffhausen am 30. Juni; ebenso in zwei Gemeinden des Kantons Bern und einer des Kantons Graubünden am 3. Juli; in je zwei Gemeinden des Kantons Waadt am 23. Mai und des Kantons Luzern am 28. Mai; in je einer Gemeinde der Kantone Neuenburg und Luzern am 14. Juni, sowie der Kantone Solothurn und Appenzell am 9. September; ferner in einer einzigen Gemeinde an folgenden Tagen, im Mai: 4. (Zürich), 8. (Luzern), im Juni: 22. (Graubünden), im Juli: 31. (St. Gallen), im August: 7. (Waadt), im September: 2. u. 13. (Zürich). Ganz vereinzelte Hagelfälle, meist nur zwei oder eine Gemeinde treffend, kamen also an 14 Tagen in zusammen 25 Gemeinden vor.

Beschreibung der Gewitter und Hagelschläge.

In der tabellarischen Zusammenstellung sind die an jedem Gewittertage aufgetretenen elektrischen Erscheinungen, nach Zügen und Gruppen geordnet, in gedrängter Kürze möglichst vollständig behandelt. Aus Kolonne 3 ersieht man den mittleren, auf Meer reduzierten Barometerstand, aus Kolonne 4 die mittlere, mit Ausnahme der Bergstationen, auf die Höhe des schweizerischen Mittellandes (ca. 500 m über Meer) reduzierte Temperatur im Gewittergebiet. Beide meteorologischen Elemente beziehen sich auf den dem Gewitterausbruch nächst vorangegangenen Beobachtungstermin $7^1/_2{}^h$ a, $1^1/_2{}^h$ p oder $9^1/_2{}^h$ p (M. E. Z.). Nur wenn die elektrischen Vorgänge kurz vor einem dieser Termine einsetzten und längere Zeit nach demselben andauerten, so entsprechen die genannten Daten diesem Zeitpunkt. Bei den Zeitangaben bedeutet a vormittags und morgens, p nachmittags und abends, n nachts, 0^h mitternachts, 12^h mittags. Der in Kolonne 8 notierte Weg des Gewitters in km pro Stunde ergibt sich nicht aus Kolonne 5, sondern aus den Isobronten der kartographischen Darstellung. Kolonne 9 stellt durch die bekannten Symbole (✳ Schnee, △ Graupeln oder Riesel, vereinzelte oder sehr kleine Hagelkörner, ▲ Hagel, ● Regen) die Art der Niederschläge, sowie deren Intensität dar. Das Zeichen K bedeutet Gewitter, ↯ Blitzschlag. In der Rubrik „Betroffene Gegend" folgen manchmal auf den die Bezeichnung der Zugsrichtung abschliessenden Doppelpunkt einzelne direkt vom K überzogene Orte, oft sind aber auch nur die Grenzpunkte der Gewitterzone angemerkt; beigefügt sind gewöhnlich auch einzelne Orte ausserhalb des Gewittergebiets, von welchen aus noch elektrische Erscheinungen beobachtet wurden. Die im Text teils in Klammer, teils sonst beigefügten, mit dem Masszeichen $^m/_m$ versehenen Zahlen geben, sofern nichts weiteres bemerkt ist, den Tagesbetrag des Niederschlags auf der betreffenden Station an. Leider wird nur auf sehr wenigen Stationen der während eines Gewitters gefallene Niederschlag gemessen. Der Kürze halber wurde anstatt „Altendorf b./Lachen", „Champ-Fahy s./Neuveville", „Crana-Torricella (Trinkwasserversorgung von Lugano)", „Gsteig b. Saanen", „Unterhallau", „Unterkulm", „Kilchberg (Baselland)", „Küsnacht (Zürich)", „Küsnacht (Schwyz)", „Langnau (Bern)", „Marbach (Luzern)", „Münster (Luzern)", „Ober-Iberg", „Les Rouges s./Chéserex", „Santa Maria im bündner. Münstertal", „Splügen (Dorf)", „Wald (Zürcher Sanatorium)", „Wil (St. Gallen)", „Glatt, Nebenfluss der Thur", gesetzt: Altendorf, Champ-Fahy, Crana, Gsteig, Hallau, Kulm, Kilchberg, Küsnacht, Küsnach, Langnau, Marbach, Münster, Iberg, Les Rouges, Santa Maria, Splügen, Wald, Wil, Thurglatt.

Zur Vervollständigung des Gewitterbildes einzelner Tage dienen die Ergänzungen, indem darin ausser weiteren „Bemerkungen" über die betreffenden Witterungsvorgänge noch die Hagelschläge festgelegt wurden, welche aus dem uns von der Direktion der Schweizerischen Hagelversicherungsgesellschaft gütigst zur Verfügung gestellten Verzeichnis der Schadenersatzmeldungen ersichtlich sind. Die hagelbeschädigten Gemeinden wurden, soweit möglich, nach ihrer topographischen Lage im betreffenden Zuge geordnet; die in Klammer beigefügten Kantonsnamen gelten für alle vorangehenden Gemeinden. In den Nachträgen fanden die lokalen Gewitter, sowie sporadisch auftretende elektr. Erscheinungen in solchen Gegenden oder an solchen Tagen Aufnahme, welche nicht in der tabellarischen Uebersicht figurieren. Die in Letzterer nur durch das Symbol ↯ angedeuteten Blitzschläge wurden, nach den üblichen Kategorien geordnet, in einem besondern Verzeichnis kurz beschrieben. Als Beigabe folgen für einige interessante Gewitterfage oder Vortage von Gewittern noch die entsprechenden synoptischen Wetterkarten.

Errata.

a. Weitere Bemerkungen:

Mai 4. Zug c. Zürich: 8.10 p Blitz im WSW, 8.45 p in 6 km, 8.57 p in 10 km im S.

5. Zug e. Zürich: 5.30–5.45 p Zugstr. im Zenith, 5.25–5.40 p 4 mm Regen, 5.30, 5.35 u. 5.40 p Hagelsteine im Regen. Bischofszell: 6 p heftiges Zugstr. mit Hagel; Schlossen während 7 Minuten, z. T. in Haselnussgrösse, ½ Stunde nachher noch sichtbar; zahlreiche Zweige und Knospen abgeschlagen.

5./6. Zug a. Büren z. Hof: Starker Hagel, am 6. morgens noch kleine Wälmchen mit Hagelsteinen. Basel 10.24 p 2 elektr. Entladungen in 17 km Entfernung. Wittnau: Zweimal das elektr. Licht für längere Zeit gelöscht. Böttstein: Hagelsteine wie Haselnüsse, abgeschlagene Zweige. Klingnau: ½11 Uhr plötzlich ein 2 Minuten dauernder Hagelfall in Klingnau, Döttingen, Tegerfelden, Zurzach; Körner hasel- bis walnussgross, den Boden bis 10 % hoch bedeckend; grosser Schaden an den Kulturen, namentlich an blühenden Obstbäumen; an mehreren Orten Fensterscheiben zerschlagen, z. B. in der Schuhfabrik Zurzach 86 Stück; in Zurzach konnte man am Morgen den Hagel noch stellenweise mit den Händen schöpfen. Andelfingen: 11 Uhr nachts gewaltiges Zugstr. mit heftigem Hagelschlag, Körner bis Nussgrösse, Schaden an blühenden Bäumen; sehr grosser Schaden in Rüedlingen an Roggen- und Kleeäckern. Hagelkörner hasel- bis baumnussgross, am folgenden Nachmittag noch massenhaft an Waldrändern und hinter Häusern zu sehen. Oberwinterthur: Zugstr.-Regen stark mit haselnussgrossen Schlossen vermischt, viel Schaden an Bäumen und Gartengewächsen. Wil-Räfz: Körner hasel- bis baumnussgross, Scheiben zertrümmert, Blütenknospen abgeschlagen. Zürich: Hagel im Regen. Winterthur: Um 11 Uhr herum war der Himmel oft nur ein Feuermeer, Hagel im Regen. Thundorf: Boden von haselnussgrossem Hagel weiss. Laut offiziellem Bericht auch Hagel im badischen Grenzgebiet von Säckingen an, im übrigen vide litt. b. Donner aus der Zugstr.-Zone noch hörbar in Valangin und am Schwäbrig, Blitze noch sichtbar in Lausanne, Lungern, St. Gallen, Teufen, Altstätten und auf dem Säntis.

6. Zug a. Nyon: Ganze Nacht 5./6. Blitze über Jura und fernes Donnerrollen; 3.50 a plötzlich heftiger Donner, dem mehrere andere nach vorausgegangenen prächtigen Blitzen folgten. Zug b. Freiburg: 4.15 a Graupelböe. Cernier: Zwei Zugstr., eines 4.05–4.20 a, ein anderes 4.40–4.50 a. Champ-Fahy: Hagel dem Chasseral entlang bis nach Lignières. Bern: Mehrere Zugstr. von äusserster Heftigkeit, diverse industrielle Betriebe infolge von Hochwasser unterbrochen. Fraubrunnen: Noch am Vormittag Hagelsteinwälmchen. Herzogenbuchsee: Starker Hagelschaden an Kulturen, Orkan Bäume entwurzelt. Olten: 5.05–5.15 a furchtbarer Hagelschlag. Triengen: 5.57 bis 6 a kirschgrosser Hagel, stark mit Regen vermischt. Aarau: Furchtbares Zugstr. mit Platzregen und Hagel, Körner bis haselnussgross, Haufen bis 11 a sichtbar, Hagel- u. Schwemmschaden sehr gross. Zurzach: Grosser Hagelschaden in Gärten u. Baumschulen. Dietikon: Hagelwetter bedeutend stärker als das gestrige; vom Südwestfenster konnte der Hagel mit Händen geschöpft werden. Zürich: 5.55–7.13 a Donner; 6.15 a so dunkel, dass man ohne künstliche Beleuchtung nicht lesen konnte; von 6.20 a fortwährend Blitze und Donnerrollen bis 6.45 a in 1–2 km Distanz, 6.55 a im S, 7 a noch im W), 6½ a Hagel, 6.30–6.32 a stark, dann noch einzelne Körner bis 6.40 a.

20. Zug a. Blitz und Donner: La Chaux-de-Fonds, Dombresson; Donner: Champ-Fahy, Biel. In Bevaix und Cortaillod fiel Hagel in solchen Mengen, dass nach 2 Stunden noch nicht alle Körner geschmolzen waren; Körner erbsengross, anfangs sehr dicht, später mit viel Regen vermischt. Der Blitz schlug an verschiedenen Orten ein. Zug c. In Lohn nur anfangs, in Diessenhofen nur eine Minute Hagel. Wilchingen: 12.15–2.30 p Niederschlag = 21.6 mm, Hagel 12.15–12.20 p und 1.15–1.18 p. Stein a. Rh.: Ein starker

Hageischauer, wohl 5 Minuten lang, Schlossen nussgross. Blüten, Blätter u. Knospen abgeschlagen. Einige Stunden nachher noch ganze Haufen in den Dachtraufen. Haidenhaus: Eine Minute lang Hagelkörner von Baumnussgrösse, hierauf während 5 Minuten wie Haselnüsse u. Erbsen.

22. Zug g. Tessin. II. Forstkreis: 3.30–3.35 p Hagelkörner von 6 $^{m}/_{m}$ mittl. Durchmesser, ohne erheblichen Schaden, weil mit Regen vermischt. Zug h. Lugano: Einige Regengüsse zwischen 3 und 8 p, 3.40–3.43 p Hagel, z. T. von Haselnussgrösse, aber mit Regen vermischt. V. Forstkreis, 17. Bezirk: Heftige und häufige elektr. Entladungen; Hagel von 3.15–3.40 p, Zug SE nach NW, Körner erbsengross, weiss, den Boden 1 $^{c}/_{m}$ hoch bedeckend, die umliegenden Höhen bis zum Abend weiss. Weil der Hagel stark mit Regen vermischt, war der direkte Schaden gering, dagegen richtete der Sturm an Bäumen und Kulturen grosse Verheerungen an. V. Forstkreis 16. Bezirk: Hagel von Nuss- und Haselnussgrösse von 3.45–3.47 p, den Boden 2 $^{c}/_{m}$ hoch bedeckend, Schaden gering. Betroffene Gemeinden vom 16. und 17. Bezirk vide litt. b.

Juni 4. Zug a. St. Imier: „Forte pluie mêlée de grêle de la grosseur de pois, sans dommage pour le haut vallon". Aarau: Hagel erbsengross, ohne Schaden. Dietikon: „Regen dauerte nicht lange, war mit Hagelkörnern vermischt, 4¾ p wieder Sonnenschein."

14. Zug a. Ein orkanartiger Sturm fegte laut „Journal de Genève" über die Westschweiz: In Lausanne wurden Zinkdächer abgehoben und Bäume geknickt, auf dem Neuenburger- und Thunersee Barken zum Umkippen gebracht.

16. Zug g. Laut „Nouvelliste vaudois" fiel in Giez s/Grandson 6.15–6.30 p und in Valleyres-sous-Montagny 6.10–6.30 p dichter Hagel von Hasel- bis Walnussgrösse; Weinberge verwüstet, Gärten zerhackt, Obst abgerissen, Getreide in den Boden geschlagen, im Dorf Giez Fensterscheiben zertrümmert.

Juli 1. Zug f. Neuchâtel: Im obern Teil der Stadt wolkenbruchartiger Regen, ebenso in den westlich davon liegenden Dörfern; Weinbergmauern eingestürzt und Keller überschwemmt. La Chaux-de-Fonds: 6.20–6.35 p Platzregen und starker Hagel; Keller überschwemmt. St. Imier: Dichter Hagel von Erbsen- bis Kirschgrösse.

4. Zug o. Zürich: Seit 7 p fast alle Minuten Donner im N, 7.27–7.45 p mehrere Donner im NW in 5–6 km Distanz, 8.20 p in 4 km im NW (Blitze z. T. zur Erde fahrend), 8.33 p in 3 km, 8.35 p in 1–2 km im NE, 8.37 p im Zenith, 8.42 p im E. Regen von 8.35 p an, 8.45 p stark, bis 9.15 p = 2.5 $^{m}/_{m}$. Zug p. Aadorf: ½6–7 p heftiges ⊼, ununterbrochen elektr. Entladungen, Hagel namentlich im nördl. Dorfteil erheblichen Schaden anrichtend, ⊼ später auf längere Zeit wiederkehrend. Eschlikon: Tagessumme des Regens = 46.5 $^{m}/_{m}$. Heiden: 8.20 p Schlag auf Schlag. Zug r. Zürich: 9.45 p Donner im SW, hoch, 9.50 p Blitzschlag nahe im SW u. Regen, 9.33 u. 9.55 p Blitzschläge im E, 10 p Hagelkörner mit Platzregen (9.55–10.05 p = 3.6 $^{m}/_{m}$), von 10.05 p an Donner fern. Zug s. Zürich. 10.25 p Donner nahe im SW, 10.25 p im Zenith, dann Regen (10.25–10.55 p = 4.8 $^{m}/_{m}$), alle ½ Minuten Blitzschläge ganz nahe, 10.33 p im W (kaum 1 km entfernt), 10.37 u. 10.39 p in 2 km, 10.47 p im E; 10.57 p Blitz in 5 km im E; Blitze im E bis ca. 11.30 p, um 11 p noch Donner hörbar.

5. Zug i. Zürich: 12.30 u. 12.45 p Donner im W, 1.05–1.07 p Donner nahe im W, 1.10 p nahe im S, 1.16 p 1 km im S, 1.17 p, Blitzschlag nahe im SE, 1.19 u. 1.20 p im SW und gleich darauf im NW, 1.23 p Blitzschlag 2 km im N, 1.24–1.26 p drei Blitzschläge im E; bis 1.38 p alle Minuten Donner im E.

12. Zug e. St. Imier: „7.20 p–0^{h} tonnerre toutes les 1–3 minutes, au zénith 7.45 p, pluie 7.40–11.50 p, lueurs rouges, tonnerres écrasants, ondées abondantes".

13. Zug b. Bericht von den Gemeindeämtern. Cavigliano: Hagelkörner haselnussgross, undurchsichtig, 10 Minuten lang fallend, der halbe Rebenertrag vernichtet. Verscio: Körner haselnussgross, 20 Minuten lang auf 2 km breitem Striche fallend. Tegna: Körner 8–10 $^{m}/_{m}$ im Durchmesser, ⅔ der Ernte vernichtet, Blitze häufig und heftig. Ronco: 7 Minuten lang Hagel von 10 $^{m}/_{m}$ im Durchmesser, Körner weiss, 5 $^{c}/_{m}$ hoch die Erde bedeckend, die Hälfte der Ernte beschädigt. Ascona: Körner haselnussgross, weiss, den Boden 1½ $^{c}/_{m}$ hoch bedeckend, Schaden beträchtlich. Losone: Körner beinahe nussgross, 2 $^{c}/_{m}$ hoch den Boden bedeckend, Schaden bedeutend. Solduno: Körner 5 $^{m}/_{m}$ im Durchmesser, wasserhell oder weiss, 10 Minuten lang fallend, gut ⅓ der Ernte zerstört. Orselina: Körner 1 $^{c}/_{m}$ im Durchmesser, ⅕ der Ernte zerstört. Muralto: Körner haselnussgross, weiss, fünf Minuten lang fallend; die Hälfte der Ernte vernichtet, teils vom Hagel, teils vom Sturm. Locarno: Körner haselnussgross, wasserhell, Hagel kam vom Ghiridone, Schaden ⅓ der Ernte; häufige und heftige elektr. Entladungen.

Bericht vom Sotto Ispettorato forestale del 9° distretto. Contra: Auf 1200 m langem und durchschnittlich 700 m breitem Striche fiel haselnussgrosser, durchsichtiger Hagel bei starkem Nordwind, die dem Winde ausgesetzten Gegenden sehr stark, die mit der Windrichtung streichenden nur wenig geschädigt. Minusio u. Brione: Hagel aus SW nach NE, auf einem Striche von 1500 m Länge und 500 m Breite 10 Minuten lang fallend und den Boden 2 $^{c}/_{m}$ hoch bedeckend; Körner weiss, 10–15 $^{m}/_{m}$ im Durchmesser; seit 1885 in dieser Gegend, sowie in Contra kein so starkes Hagelwetter; in Minusio allein 50000 Franken Schaden, ¾ der Weinernte vernichtet, zudem grosser Schaden an Obst, Feldfrüchten und Gras.

14. Clarens: 3 a Mondregenbogen. Zug c. Zürich: Hagel bis zur Grösse von kleinen Baumnüssen; Schaden an Gärten, Obstbäumen und Reben. Mettmenstetten: „Hier Hagel mit Regen vermischt, aber immerhin noch ganze Mahden von Eiskörnern; enormer Schaden im Aeugstertal: Bäume absolut kahl, Feldfrüchte zerhackt, Gras zerfetzt und in den Boden geschlagen". Winterthur: Hagelkörner haselnussgross, ziemlich grosser Schaden an Obstbäumen, in Gärten und Reben. Muri: An der Albiskette grosse Flächen weiss von Hagelschlag.

15. Zug c. Mettmenstetten: Getreide ganz zerhackt, Hagelsteine grösser als am 14.

28. Zug a. Grosse Regenmengen (Tagessummen): Mont Soleil 88.2 $^{m}/_{m}$, Fontainemelon 54.5 $^{m}/_{m}$, Saignelégier 33.5 $^{m}/_{m}$, Dombresson 25.3 $^{m}/_{m}$, St. Imier: „Pluie diluvienne, abîmant les jardins, défonçant les chemins". Zug f. Davos: Überschwemmung am Bildi-, Gugger- und Schierbach, Schlammabfluss auf die Promenade. Surrhein: Von 9 p an ohne Unterbruch Blitz und Donner.

August 5. Basel: Den ganzen Vormittag Sonnenring. Zug c. Tagessummen des Niederschlags: Les Rouges 99.0 $^{m}/_{m}$, Nyon 80.0 $^{m}/_{m}$, La Cure 69.2 $^{m}/_{m}$, Morges 67.5 $^{m}/_{m}$, Le Sentier 53.2 $^{m}/_{m}$, Cossonay 74.7 $^{m}/_{m}$, Montcherand 52.5 $^{m}/_{m}$, Chaumont 41.9 $^{m}/_{m}$, Dombresson 51.2 $^{m}/_{m}$, Serrières 46.7 $^{m}/_{m}$, Payerne 43.5 $^{m}/_{m}$, Biel 38.9 $^{m}/_{m}$, Lyss 28.0 $^{m}/_{m}$, Bern 17.5 $^{m}/_{m}$.

30. Grosse Regenmengen: Generoso 40.7 $^{m}/_{m}$ wovon 37.2 $^{m}/_{m}$ von 1½ p [30.] bis 7½ a [31.]), Crana 97.2 $^{m}/_{m}$, Rivera 113.2 $^{m}/_{m}$, Braggio 103.3 $^{m}/_{m}$ wovon 87.2 $^{m}/_{m}$ von 1½ p [30.] bis 7½ a [31.]), Grono 62.2 $^{m}/_{m}$ (Ausbruch der Calancasca, 70 m der Landstrasse, sowie 120 m Bahndamm der Mesolcina-Bahn fortgerissen, Grono vom Verkehr mit Roveredo abgeschnitten), Castasegna 76.1 $^{m}/_{m}$.

September 4. Zug a. St. Imier: „Pluie diluvienne, un éclair très bas ressemblant à un serpent de mer, qui s'évanouit sans éclat de tonnerre". Tramelan: „Pluie très violente (15.9 $^{m}/_{m}$) six décharges électr. faibles". Biel: „10 p heftiger Schlag mit starkem Regen" (30.8 $^{m}/_{m}$). La Chaux-de-Fonds 53.6 $^{m}/_{m}$. Dombresson 42.5 $^{m}/_{m}$. Zug b. Palézieux 46.8 $^{m}/_{m}$, Romont 39.8 $^{m}/_{m}$, Marsens 54.0 $^{m}/_{m}$, Murten 32.0 $^{m}/_{m}$, Adelboden 45.0 $^{m}/_{m}$, Heiligenschwendi 28.2 $^{m}/_{m}$, Wimmis 49.6 $^{m}/_{m}$, Lauterbrunnen 45.1 $^{m}/_{m}$.

21. Wolkenbruch am Bachtel und Allmann. Wernetshausen: 5.40 p bis nachts = 60.9 m/m, Richtung SW–NE. Am Westabhang des Allmann Wege und Strassen arg zugerichtet. Laut „Anzeiger von Uster" musste in Hinwil und Unterwetzikon die Feuerwehr zum Schutze der Häuser und Gärten aufgeboten werden. Dammbruch an einem Fabrikkanal in Oberuster. Wegschwemmen der Gerüstung für die Strassenbahnbrücke in Kirchuster. Von den Nachbarstationen hat nur Bauma eine grosse Regenmenge, 48.. m/m, Sanatorium Wald dagegen bloss 12.4 m/m, Niederuster gar nur 1.5 m/m. Der Wolkenbruch verzog sich also ins Tösstal.

Oktober 18. St. Gallen 6.50 p (im E), Degersheim, Schleitheim 7 p (im E).

Verzeichnis der bekannt gewordenen Blitzschläge.

In Gebäude.

a) Mit Zündung:

Mai 6. In Payerne ca. 4.30 a ein Haus samt Scheune, in Walkringen (eine Stunde nordwestl. von Grosshöchstetten) zwischen 5.15 und 5.45 a ein Haus eingeäschert. **22.** Am Rossberg, oberhalb Hütten um 4 a ein Heimwesen eingeäschert.

Juni 5. Auf Oberschwendi bei Altendorf (Lachen) um 9 p ein Haus in Asche gelegt. **16.** In Villars-les-Moines um 8 p ein Bauernhaus eingeäschert.

Juli 4. Um 7 a das Wirtschafts- und Wohngebäude des Hardhofes bei Wildegg in Asche gelegt. **26.** Um 7½ p in eine Scheune am Hirschberg, 1 km nordöstlich von Appenzell, Heu und Balken entzündet, Brand vom Besitzer gelöscht. **28.** Nach 4½ p Wohnhaus und Scheune in Chevressy b/Yverdon, nach 7¾ p Wohnhaus und Scheune in Menzingen eingeäschert. **30.** Zwischen 4 u. 6 p eine Sennhütte im Moosfang (unweit der Strasse Saanen-Gsteig, 5 km südöstlich von Saanen) eingeäschert.

August 5./6. Um Mitternacht in einen Bauernhof in Landecy (Kt. Genf), Scheune eingeäschert, Wohnhaus gerettet.

b) Mit teilweiser Demolition:

Mai 5. In Oberhittnau (Kt. Zürich) zwischen 5 u. 6 p in einen Bauernhof. Eine Anzahl Ziegel und Dachbalken zertrümmert Strahl durch den Stall ins Freie ohne weitern Schaden anzurichten. In Oberwinterthur um 11 p in eine Scheune neben dem Rössli, Dach etwas beschädigt. **20.** In Stein (Kt. Schaffhausen) 1½ p in ein Gartenhaus, Kamin zerstört. In Möhlin 4.10 p ins Schulhaus, Giebelmauer beschädigt. In Geneveys s/Coffrane 4.15 p in ein Haus, Kamin demoliert.

Juni 4. Im Widenmoos b/Eggerstanden, laut „Appenzeller Nachrichten", ca. 4 p in das Kamin eines Hauses: Der über das Dach hinausragende Teil heruntergeworfen, die übrige Partie der Länge nach gespalten, die beiden Öfen zerrissen, die Türe in die Stube geworfen, die Fenster hinausgesprengt, zwei Treppen und Böden zerstört.

August 5. Zwischen 5 u. 6 p in Saconnex-d'Arve in ein Haus, etwelche Beschädigung anrichtend. **29.** Um 11.15 p drang, laut „Liberté", ein Blitzstrahl in Châtel-St. Denis in ein Haus, den Küchenboden aufreissend, 35 Fensterscheiben zersplitternd, eine Mauer spaltend und eine Türe wegreissend, dann in den Stall, denselben lichterloh beleuchtend, so dass das erschrockene Vieh die Ketten sprengte, und verschwand hierauf ohne merklichen Schaden.

c) Ohne nennenswerten Materialschaden:

Mai 6. In Ligerz (Kt. Bern) in ein Haus. **11.** In den Bahnhof Olten 6.29 p, ein Leitungsdraht in der Halle geschmolzen. **28.** In Montlingen unweit Altstätten, 12h, in den Kirchturm.

Juni 5. Zirka 200 m von der Station Oberiberg, 6 p, in einen Stall, Schaden gering. In Ottenbach zwischen 8½ u. 8¾ p in die Kirche. In Uster, 8.40 p „Kaltschlag". **6.** In Ulmiz, ca. 12h in ein Haus.

Juli 4. In ein Haus in Rugell (Lichtenstein) ca. 2.15 p. Zwischen 8¾ u. 9 p zwei Kaltschläge in Uster. **16.** Um 4.15 p in die Trinkhalle nahe bei der Kirche von Beatenberg.

August 5. Zwischen 5 u. 6 p in 2 Gebäude an der rue Pradier in Genf.

In Blitzableiter.

Juni 16. Uhrenfabrik St. Georges unterhalb Marchairuz (Waadt): Gegen 6 p Haus einige Sekunden wie vom Feuer eingehüllt, die Insassen sowie nahe beim Gebäude stehende Personen heftig erschüttert.

Juli 4. Um 1¾ p in einen Ableiter des Asyls St. Urban, ebenso in denjenigen einer fünf Minuten von der Anstalt entfernten Scheune. **5.** Um 1½ p in Rinkenbach, 1 km westlich von Appenzell.

August 21. Um 8 p in den Ableiter der Apotheke Muri (Kt. Aargau).

In Bäume.

Mai 20. In Unterhallau 11.55 p ein Rosskastanienbaum beim Gasthof zum „Schweizerbund" zerschmettert.

Juni 6. In Löwenberg b/Murten, ca. 12h, in eine Esche.

Juli 1. Um 4.30 p bei Davos-Platz in einen Baum am Abhang des Jakobsberges. **4.** Zwischen 1¾ u. 2 p, in einen Obstbaum 5 Minuten und in einen zweiten, 10 Minuten vom Asyl St. Urban entfernt. Um 2.50 p bei Altstätten in mehrere Bäume. **5.** Bei Dietikon, 1.55 p, in einen Birnbaum. **28.** Auf der Alp Cortedo (Gemeinde Sonogno), zwischen 8½ u. 9 p, eine 20 m hohe Lärche geknickt. Um 9.35 p in den Wald bei Davos-Platz.

August 5. Genf. Eine Tanne auf dem Gute „Aux Arpillères" zerschmettert.

In sonstige hohe Gegenstände.

Juni 16. In einen Pfahl beim Friedhof von St. Georges unterhalb Marchairuz (Waadt), Personen in der Nähe heftig erschüttert.

In Telephon- und Telegraphenleitungen.

Mai 5. In Oberwinterthur, 11 p, vom Telephonträger eines Hauses neben dem Rössli in die Telephonapparate der Nachbarhäuser, die Sicherungen schmelzend.

Juli 4. Um 2.50 p bei Altstätten in die Telephonleitung. Gegen 7 p in die Leitung der Gemeindesprechstation Thundorf. **5.** Um 1½ p in eine Telegraphenstange in Rinkenbach, 1 km westlich von Appenzell.

In elektrische Starkstromleitungen.

Mai 20. In Fontainemelon ca. 5 p, Maschinen der Uhrenfabrik gestellt. **22.** Um 6.30 p ins Elektrizitätswerk Triengen.

Juni 5. In Ottenbach zwischen 8 u. 9 p mehrmals in Hochspannungsleitungen. **21.** Mervelier um 9.30 p, Licht auf einige Zeit gelöscht.

Juli 6. In die elektr. Beleuchtungsanlage des Schulhauses Wernetshausen 3.35 p. **15.** Zwischen 2½ u. 2¾ p in die Zentrale von Cham, ohne erheblichen Schaden. **28.** Um 9.35 p in die Lichtleitung in Davos-Platz.

August 5. Neue-Welt, um 8 p in die „Electra". **21.** Zwischen 9.25 u. 9.45 p Störung der elektr. Beleuchtung in Gelterkinden.

September 2. In Eien b/Böttstein, 6 p, Motor einer Sägerei in Brand gesteckt.

In Tramwaywagen.

Juni 14. In Genf, ca. 3¾ p, ohne Schaden.

August 5. Zwischen 5 u. 5¼ p mehrmals in Genf, unter andern bei der „Rampe Quidort", an der „Coulouvrenière", vor dem „Parc des Eaux-Vives" und in Carouge.

In Personen.

a) Mit Tötung:

Mai 4. In Hausen a/Albis, 9 p, ein Mann erschlagen, als er die eiserne Schliesstange des Scheunentors in Funktion setzen wollte; die daneben stehenden Personen (Frau und Kind) nicht verletzt.

Juni 6. In Ulmiz (Murten) ca. 12h ein Mann in seiner Stube erschlagen. **14.** Auf der Allmend bei Bern, ca. 5½ p ein 13-jähriges Mädchen erschlagen. **21.** In Courlevon (1 Std. südsüdöstl. von Murten) 6 p, ein Mädchen auf der Türschwelle des Hauses erschlagen.

Juli 1. Gegen 7 p ein Mann auf einem Hofe, 4 km südwestl. von La Brévine erschlagen.

b) Mit zeitweiliger Betäubung oder starker Verletzung:

Juni 4. Im Widenmoos (Eggerstanden), ca 4 p, ein in einer Küche arbeitender Kaminfeger durch Brandwunden im Gesicht verletzt.

August 29. Um 11.15 p einem vor seinem Hofe stehenden Pächterssohne in Châtel-St. Denis die Laterne entrissen und letzteren auf mehrere Stunden betäubt.

c) Mit momentaner Betäubung oder leichter Verletzung:

Mai 28. In Montlingen, unweit Altstätten, zwei in der Kirche läutende Knaben ganz leicht verletzt.

Juni 4. Im Widenmoos (Eggerstanden), ca. 4 p, ein in der Stube sitzender alter Mann unbedeutend verletzt.

In Tiere.

Mai 22. 1 km südlich von der Station Muralto (Locarno) 3.40 p zwei Pferde getötet.

Juni 16. In Villars-les-Moines (Münchenwiler, unweit Murten), 8 p, ein Haushund, um 8 p auf der Alp Montagne du Sacelet (Sasselet, Gemeinde Mont-la-Ville) vier Rinder erschlagen.

Juli 4. Zirka um 8½ a in Kriesern, 3 km östlich von Altstätten, auf dem Felde eine weidende Kuh erschlagen.

In nicht ermittelte Objekte.

Mai 6. Hagneck, zwischen 4¾ u. 5 a; La Valsainte 4.55 a, unweit der Station; Bucheggberg zwischen 5½ u. 5¾ a. **11.** Glattbrugg, zwischen 7 u. 7.05 p (bei Ankunft des Zuges Zürich–Schaffhausen).

Juni 5. Wil-Rafz, zwischen 9 u. 10 p zweimal. **30.** Bellelay, 6 p, unweit der Station.

Juli 4. Säntis 7.57 a, zweimal. **5.** Luzern, 12.10 u. 12.13 p. **13.** Lugano, 10.10 p, unweit der Station. **14.** Zürich, einigemal in der Nähe des Eidgen. Physikgebäudes.

August 5. Dietikon 9.10 p.

Kugelblitze.

Mai 20. Möhlin. Nach Aussagen von Drittpersonen, um 4.10 p, Blitz „faustgross" von der Schulhausmauer dem Boden nach rollend.

August 5. In No. 8, 4. Stock der rue Pradier, Genf, zwischen 5 u. 6 p eine „feurige Kugel" im Zimmer gesehen.

Anhang.

Meteorerscheinungen. **November 23.** Genthod (Genf), 5.34 p, ein Meteor von solcher Helligkeit, dass es durch die Wolken hindurch gesehen wurde; ebenfalls in Annemasse beobachtet, Licht blau und rot, Richtung von N nach S.

Nordlicht. **Oktober 24.** Hallau.

J. Mettler.

Erklärung zu den Tafeln.

Die am Schlusse beigefügten Kärtchen sollen die Tage mit den prägnantesten Gewitterzügen zur Anschauung bringen. Sofern der Raum es gestattete, wurden überhaupt alle Züge des betreffenden, eventuell auch noch solche eines andern Tages eingezeichnet. Das Symbol ▲ bedeutet vereinzelt aufgetretene Hagelschläge, während grössere zusammenhängende Hagelstriche durch Schraffierung bezeichnet sind. Die Pfeile geben die Richtung des Gewitters an; konnte dieselbe nicht ermittelt werden, so markiert ein Punkt den Ort der elektrischen Entladungen. Die Kurven verbinden die Stationen mit gleichzeitigem Eintritt des Gewitters im Zenith des Beobachters. Die Ziffern bezeichnen die Zeit in Stunden und Viertelstunden (0h = Mitternacht; 12h = Mittag). In den Ecken der Tafeln sind Marken angebracht, um eine allfällige Verschiebung der Zeichnung gegenüber dem Untergrund erkennen zu lassen. Die hinter den Ziffern stehenden kleinen Lettern a und p bedeuten ante meridiem und post meridiem, die grössern neben oder in dem Zuge stehenden beziehen sich auf Kolonne 2 der tabellarischen Zusammenstellung.

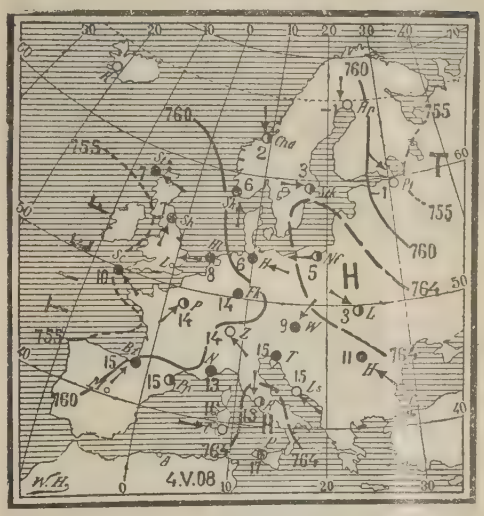
Synoptische Wetterkarten

für einzelne Gewittertage des Jahres 1908.

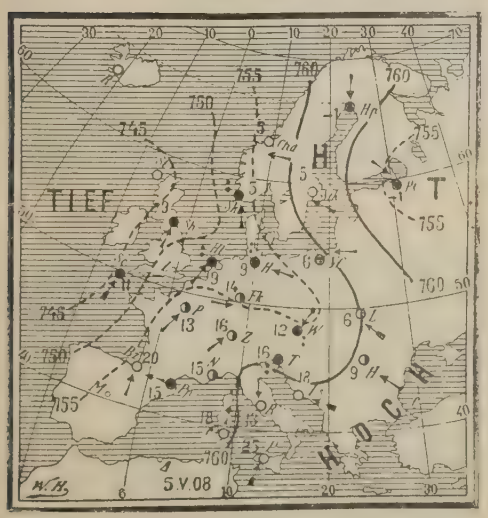
Symbole: ○ hell, ◑ wolkig, ● bedeckt, : Regen, ⟶ Sturm.

29. April 1908.

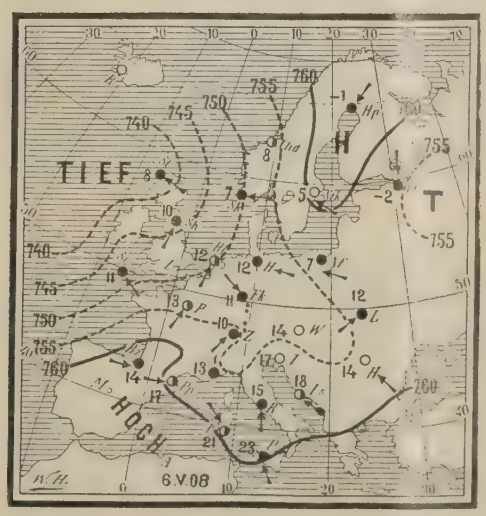
4. Mai 1908.



5. Mai 1908.



6. Mai 1908.



Anmerkung: Die eingezeichneten Kurven (Isobaren) verbinden die Orte mit gleichem um 7 resp. 8 Uhr morgens abgelesenem (auf das Meeresniveau reduziertem) Barometerstand; durch die Worte „Hoch“ und „Tief“ werden barometrische Maxima und Minima bezeichnet. Die Zahlen neben den Stationen geben für vorgenannte Zeit die Temperatur in Graden (Celsius); die Windrichtung ist durch Pfeile markiert.

Nr. 4.

Ergebnisse der Registrierungen des Sonnenscheinautographen im Jahr 1908

auf den Stationen:

Lugano, Genf, Lausanne, Clarens, Rochers de Naye, Chaux-de-Fonds, Neuenburg, Bern, Heiligenschwendi, Basel*), Buus, Liestal, Hallau, Zürich, Haidenhaus, Wald (Sanatorium), Davos, Arosa, St. Moritz und Säntis.

*) Basel (Bernoullianum) besitzt seit Januar 1908 einen neuen Sonnenscheinautographen (Modell Negretti & Zambra).

Die nachstehenden Tabellen geben einerseits für jeden Tag des Jahres eine synoptische Uebersicht der Sonnenscheindauer an den verschiedenen Stationen, anderseits die Monats- u. Jahressummen für jede Tagesstunde

1908. **Tägliche Dauer des Sonnenscheins in Stunden.**

Januar.

Anmerkung. Die Pentadenmittel der Lufttemperatur sind aus den rohen Tagesmitteln $^1/_3 (7+1+9)$ gebildet, während die Monatsmittel in obstehender Uebersicht, entsprechend denjenigen in den Monatsübersichten sämtlicher Stationen, nach der Kombination $^1/_4 (7+1+2\times9)$ gebildet sind.

Nr. 6.

Regenkarte der Schweiz

(basierend auf 40jährigen Mittelwerten 1864—1903).

Von ***J. Maurer.***

Die beiliegende Regenkarte der Schweiz, welche die Verteilung der mittleren jährlichen Niederschlagshöhe veranschaulicht, beruht auf dem Beobachtungsmaterial, das an 362 Orten[1]) im Laufe der 40 Jahre (von 1864—1903) gesammelt und bei näherer kritischer Prüfung für eine synoptische bezw. kartographische Darstellung als brauchbar befunden worden ist. Schon aus den ersten Untersuchungen von J. Fretz[2]), dann wenig später von A. Benteli, — der bereits im Jahre 1870 der „Schweiz. meteorologischen Beobachtungen" die mittleren Monats- und Jahressummen für die Jahre 1864—1869 von sämtlichen damals bestehenden Stationen zusammengestellt, daraus die Niederschlagsmengen der sieben Hauptflussgebiete berechnet und die Jahresmengen in einer Karte mit Regenhöhenkurven zur Darstellung gebracht hat, — trat ziemlich deutlich zu Tage, dass jene Stationen (ca. 100 an Zahl) bei weitem nicht ausreichen konnten, um die Niederschlagsverhältnisse unseres Landes, dessen orographisches Relief ein so mannigfaltiges ist, auch nur in den ersten Umrissen bezüglich ihrer räumlichen Verteilung darzustellen, ganz abgesehen davon, dass die Beobachtungsreihe von sechs Jahren eine viel zu kurze genannt werden muss, um den mittleren Betrag der Regenmengen mit einiger Sicherheit festzustellen.

In Anbetracht, dass gerade in unserem Lande, neben den Projekten zur Ausnutzung der Wasserkräfte, auch die Lösung wichtiger kulturwirtschaftlicher Aufgaben (Flusskorrektionen, Regulierung der Hochwasserstände, Projekten für Fluss- und Seeregulierungen, Massnahmen gegen die Schäden der Wildbäche im Gebirge usw.) eine genauere Kenntnis der Niederschlagsmengen in den einzelnen Landesteilen verlangt, — sowohl was die totale Menge, als auch die Maxima innerhalb eines Tages und noch kürzerer Zeiträume betrifft, — war es daher sehr zu begrüssen, als seit der zweiten Hälfte der siebziger Jahre zu dem bestehenden Netze der vollständigen meteorologischen Stationen allmählig noch eine grosse Zahl von Spezialstationen mit dem besonderen Zweck der Messung der Regenmengen etabliert wurde. Ein solches Netz von pluviometrischen Stationen entstand zuerst im Kanton Zürich, dann folgten bald die Kantone Thurgau, St. Gallen und Appenzell, so dass die Gesamtzahl der in der Nordostschweiz funktionierenden Regenmesstationen mit Ende 1880 auf etwa 90 stieg. Die 1881 zum eidgenössischen Institut erhobene Zentralanstalt nahm alle diese als Stationen dritter Ordnung in ihr Netz auf und sorgte für die Etablierung von weiteren solchen Beobachtungsposten in den übrigen Teilen des Landes. Dies geschah unter finanzieller Mithilfe der kantonalen Regierungen und zum Teil auch von Privaten und Gesellschaften sukzessive in den Kantonen Baselland, Aargau, Schaffhausen, Luzern, Schwyz, Zug, Waadt, Freiburg, Neuchâtel, Solothurn und Genf. Am spätesten, nämlich erst im Jahre 1892, trat der Kanton Graubünden mit 22 neuen Regenmesstationen in die Reihe; gegen Ende des Jahrhunderts noch Bern, das Tessin und Wallis. Im ganzen stieg die Zahl der Stationen, wo Niederschlagsmessungen gemacht werden, auf ca. 280. Diese Zahl erleidet natürlich von Jahr zu Jahr unvermeidliche Schwankungen. Rechnet man die Orte dazu, wo in früheren Jahren Messungen gemacht worden sind, die aber später sistiert wurden, so kommt man auf die Zahl von ca. 300 Beobachtungsposten, — total mit Einschluss der meteorologischen aber auf etwa 400 Stationen —, von welchen längere oder kürzere Reihen von ombrometrischen Beobachtungen vorliegen.

Nach Ablauf des 30jährigen Zeitraumes (1864—1893) folgte die für ihre Zeit treffliche, aus dem gesamten damals vorhandenen Beobachtungsmaterial konstruierte Regenkarte (Masstab 1 : 1 000 000) von R. Billwiller[3]), der wir nun nach Verfluss der 40jährigen Beobachtungsreihe (1864—1903) eine weitere verbesserte Auflage folgen lassen. In erster Linie stellte sich auch hier natürlich die Notwendigkeit heraus, das sehr weitschichtige umfangreiche Material vergleichbar zu machen; da die Regenmenge an ein und demselben Orte zeitlich oft grossen Variationen unterworfen ist, die Jahresmengen in den einzelnen Jahrgängen daher sehr stark schwanken — die regenreichsten Jahre können die doppelte bis nahezu dreifache Jahresmenge der trockensten liefern —, so ist es selbstverständlich unzulässig, die Ergebnisse der Beobachtungsposten mit verschiedener Beobachtungsdauer und zum Teil aus verschiedenen Jahrgängen ohne

[1]) Die Gesamtzahl der Beobachtungsposten selbst ist noch etwas grösser und erreicht nahezu 400; um aber die Karte nicht stärker zu überladen, sind besonders im nördlichen Flachland einzelne Stationsorte nicht eingezeichnet, aber für den Kurven-Entwurf mitbenützt worden.

[2]) J. Fretz: „Die Niederschläge während vier Jahren (1864—1867) nach Jahreszeiten in der Schweiz". (Zeitschr. f. schweizer. Statistik, Jahrgang IV, 1868.)

[3]) Vrgl. R. Billwiller „Die geographische und jahreszeitliche Verteilung der Regenmengen in der Schweiz". (Schweiz. Zeitschr. für Forstwesen, Jahrgang 1897, No. 6/7.)

weiteres zusammenzustellen. Wie bekannt, können aber solche verschiedenartige Beobachtungsreihen ohne grosse Schwierigkeit auf eine gemeinsame Beobachtungsperiode reduziert werden; denn wenn auch die absolute Regenmenge von Ort zu Ort auf kürzere Distanzen variiert, so bleibt doch, nach dem zuerst von Fournié aufgestellten Erfahrungssatz, für benachbarte Stationen unter gleichartigen topographischen Verhältnissen der Quotient ihrer Jahresmengen nahezu konstant. Mittelst des aus einer kürzeren aber gleichzeitigen Messungsreihe ermittelten Verhältnisses lässt sich daher durch eine einfache Proportion, wie uns Hann und Hellman schon an genügenden Beispielen vor Jahren gezeigt haben, der Betrag der jährlichen Niederschlagshöhe für die gewählte Normalperiode, auch bei Nachbarstationen mit unvollkommenen Beobachtungsserien, mit praktisch genügender Sicherheit ermitteln.

Als Normalperiode für die vorliegende spezielle Darstellung haben wir, wie schon oben bemerkt, die 40 Jahre 1864—1903 zu Grunde gelegt und auf diese Periode wurden sämtliche Messungsresultate bezw. Jahresmengen der Stationen mit kürzeren Jahresserien reduziert; kürzere als 5jährige Teilserien wurden für diese Reduktion aber nicht verwertet. Es sei hier nur noch erwähnt, dass die Zahl der Stationen mit vollständiger Beobachtungsreihe für die 40 Jahre eine verhältnismässig geringe ist; es sind ihrer nämlich kaum 30. Durch eine sorgfältige Kombination bei den Vergleichungen dürfte es indessen doch gelungen sein, mittelst der erwähnten Reduktion die normalen jährlichen Niederschlagshöhen innerhalb einer Fehlergrenze von etwa ± 40 $^{m}/_{m}$, bei der Mehrzahl der Stationen jedoch noch mit grösserer Sicherheit, zu bestimmen [1]).

Alle diese Ausführungen gelten, wie ausdrücklich hervorzuheben ist, nur für die Reduktion der Jahressummen des Niederschlages; auf die Monatswerte im einzelnen ist die Methode ceteris paribus natürlich nur dann anwendbar, wenn erheblich längere Reihen, d. h. mindestens mehrere Jahrzehnte gleichzeitiger Beobachtungen, vorliegen.

Die örtliche Verteilung der durchschnittlichen jährlichen Niederschlagshöhe lässt sich natürlich am übersichtlichsten in einer kartographischen Darstellung wiedergeben; wir haben daher mittels der auf oben angegebenen Weise hergestellten Normalwerte der Jahresmengen (abgeleitet aus der 40jährigen Periode 1864—1903) in der beigegebenen Karte ein Bild von der Verteilung der mittleren jährlichen Niederschlagshöhe zu geben versucht, das in verschiedenen Teilen von den früher konstruierten Niederschlagskarten unseres Landes etwas abweichend ist. Es wird kaum nötig sein, die bei der Konstruktion der Karte angewandte Methode eingehend zu erläutern. Die ermittelten Jahreswerte der mittleren jährlichen Niederschlagshöhen, d. h. die Menge des während eines Jahres im Durchschnitt der 40 Jahre gefallenen Regenwassers oder zu Wasser geschmolzenen Schnees — ausgedrückt durch die Höhe, bis zu welcher dasselbe den Erdboden bedecken würde, wenn es nicht in den Boden einsickerte, abflösse und zum Teil auch verdunstete — wurden zunächst in die Karte eingetragen und hierauf die Kurven gleicher Regenhöhe von 20 zu 20 cm gezogen und hiebei, fussend auf die Tatsache, dass die Regenmenge mit der Bodenerhebung zunimmt, die Terrainverhältnisse so gut als möglich berücksichtigt. Bei einem topographisch so überaus mannigfaltigen Gebiet, wie unser Land es repräsentiert, empfahl sich eine noch weitergehende Abstufung resp. Detaillierung nicht; es können die in unserer Karte reproduzierten Kurven gleicher Niederschlagshöhe, namentlich fürs Gebirge, auch kaum mehr als eine erste, rohere Annäherung an die Wahrheit gelten in Anbetracht der doch immer noch viel zu geringen und zu ungleichmässigen Verteilung der Stationszahl. Das ergibt sich auch sofort, wenn man versucht, die Regenkurven für einen etwas grösseru Kartenmasstab (z. B. 1 : 500 000) zu konstruieren. Schon hier treten beim ersten Entwurf der Isohyeten im Gebirge die zeichnerischen Schwierigkeiten in so ausgeprägtem Masse zu Tage, dass man wohl Phantasiegebilde, nicht aber reelle Tatbestände darzustellen vermag.

Die Lage der Stationen, d. h. der Orte, von denen Beobachtungsergebnisse vorliegen, sind in der Karte durch Punkte und Namen angegeben, sowie der Betrag der ermittelten jährlichen Niederschlagshöhe, abgerundet auf ganze Centimeter, für jeden einzelnen Beobachtungsposten noch beigeschrieben [2]). Wichtig ist hauptsächlich für den Hydrologen, auf diese Weise für jede der eingezeichneten Stationen die mittlere jährliche Niederschlagsmenge nunmehr selbst aus der Karte entnehmen und für notwendige Berechnungen in speziellen Einzugsgebieten zu Grunde legen zu können. Leider zeigt das gesamte Gletschergebiet, wie insbesondere die grosse Hochgebirgsregion, auch auf unserer neuen Karte, betreffs Besetzung mit Beobachtungsposten noch gewaltige Lücken. Der nur einigermassen verlässlichen Messung des Niederschlagselementes stehen ja bekanntermassen in der alpinen Hochregion, ganz abgesehen von der übrigen Schwierigkeit bezüglich Beschaffung zuverlässigen ständigen Personals namentlich zu der Winterszeit, äusserst schwer zu überwindende Hindernisse entgegen. Wir haben es in allerletzter Zeit an keinen Bemühungen fehlen lassen, auf einzelnen besonders wichtigen Punkten der Gletscher- und Hochgebirgsregion neue und beständig bediente Regenmesstationen einzurichten, so am Gotthard- und Grimselhospiz, auf der Bernina, am Grindelwald-, Rhone- und Eigergletscher usw., die hoffentlich ihre nützlichen Früchte tragen werden auch bezüglich der wichtigen Frage über die Verteilung der Niederschläge in den verschiedenen alpinen Höhenregionen.

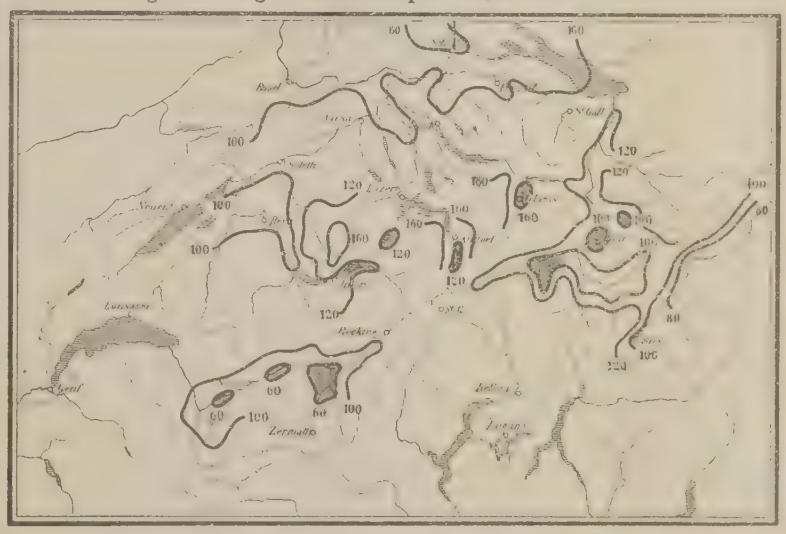
[1]) Der wahrscheinliche Fehler eines 30jährigen Niederschlagsmittels beträgt noch 2,0, der eines 40jährigen 1,7 und der eines 50jährigen 1,5 %.

[2]) Die Jahressummen selbst (in Millimetern) für die zu Grunde gelegte 40jährige Periode finden sich übrigens in besonderer Beilage zusammengestellt — von 396 meteorologischen und Regenmess-Stationen der einzelnen Flussgebiete des Landes — in der umfangreichen speziellen Publikation „Das Klima der Schweiz", Preisschrift, herausgegeben von der Stiftung von Schnyder v. Wartensee mit Unterstützung der Schweiz. Meteorol. Zentralanstalt, bearbeitet von J. Maurer in Gemeinschaft mit R. Billwiller jr. und C. Hess.

Aus der Karte entnehmen wir manche wünschbaren Details über die örtliche Verteilung der mittleren jährlichen Niederschlagsmengen in unserem Lande, wie sie übrigens schon von R. Billwiller in seiner oben erwähnten Arbeit genügend markiert worden sind. Die niederschlagsreichsten Gebiete finden wir wieder im Jura am Mont Risoux, dem westlichen Hang des südwestlichen Teils jenes Höhenzuges, wo die mittlere Jahresmenge noch 2000 mm erreicht, bezw. übersteigt (z. B. Mines Risoux mit 1903 mm, Chalet Capt oberhalb Le Sentier im Jouxtal mit 2068 mm). Ein weiteres Maximum der Regenmenge entfällt auf das Gebiet der höchsten Berneralpen, ferner des Gotthardmassivs (leider etwas unsicher) und der zwischen dem Rhein- und Tessingebiet liegenden Tessiner- und Bündneralpen (Bernhardin mit 2300 mm), das ebenfalls 2000 mm wieder übersteigt. Eine dritte Zone starken Niederschlags konzentriert sich endlich am Alpsteingebirge des äussersten nordöstlichen Teiles des Landes, wo die Station am Säntisgipfel mit 2500 mm mittlerer jährlicher Niederschlagshöhe erscheint. Auch die Niederung der Südschweiz, so namentlich das Gebiet des obern Langensees, weisen eine ganz bedeutende Niederschlagsmenge auf; wir finden auf der neuen Regenkarte dort ebenfalls eine Jahreskurve mit 2000 mm und darüber (die oft sehr intensiven Gewitterregengüsse in dieser Gegend tragen das ihrige dazu bei: so erscheint z. B. Russo im Onsernonetal mit 2003 mm, Borgnone mit 2180, Brissago mit 2070 und Crana-Sigirino in einem Seitentale des Valle Cusello mit 2185 mm).

Neben der relativ niederschlagsarmen Zone unmittelbar in den Tälern an der Nordflanke (im Windschutze) der mächtigen Berneralpen, die hier so markiert entgegentritt, bieten uns dann auffällige charakteristische Eigentümlichkeiten bezüglich der Niederschlagsverhältnisse namentlich auch die innern Täler des Rheins und der Reuss. Aufwärts gegen die Gegend von Chur und das Hinterrheintal nimmt die Niederschlagsmenge augenfällig stark ab; auch das höhere Davos im Anschluss an das Prätigau zeigt ähnliches, und ebenso mindert sich die Regenmenge vom Eingangstor des Vierwaldstättersees und Schwyzergebietes beträchtlich gegen den Ursprung des Reusstales hinauf. Wir berühren hier überhaupt eine besonders hervorstechende Eigentümlichkeit der Täler unserer nordalpinen Föhnzone, die auf langjährigen und sorgfältigen Aufzeichnungen beruht: Es sind dies stark hervortretende sekundäre Minima der mittleren jährlichen Niederschlagshöhe, so wie wir dieselben aus unserer neu konstruierten und eingehend revidierten Karte der Niederschlagsverteilung, basierend auf den 40jährigen Beobachtungen (1864—1903) sämtlicher meteorologischen und Regenmessstationen unseres Landes, ohne weiteres entnehmen können. Das auffällige Zurücktreten der mittleren jährlichen Niederschlagsmenge zeigt sich nach der hier gegebenen Kartenskizze deutlich in den Hauptföhntälern am Nordhang, im obern Aare-, Reuss-, Linth- und Rheintal, ebenso wie im Föhngebiet der Sarner Aa. Leicht wäre es, aus den in der Karte publizierten mittleren jährlichen Niederschlagshöhen einer Reihe von typischen Stationen dieser Gebiete das auffällige sukzessive Ab- und dann wieder stärkere Anschwellen der einzelnen Niederschlagswerte gegen den Talhintergrund näher zu belegen. In welchem Masse das Auftreten des Föhns in den innern Alpentälern zu dieser Verminderung der Regenmengen beiträgt — bei Föhn haben wir es ja immer mit einer absteigenden, die Kondensation des Wasserdampfes tatsächlich nicht begünstigenden Luftbewegung zu tun — bleibt noch eine offene Frage.

Niederschlagsverteilung in den nordalpinen Föhntälern der Schweiz.



Mittlere jährliche Niederschlagshöhen in Centimetern.

Es erübrigt noch, ganz kurz auf unsere Landesgebiete mit verhältnismässig geringen Regenmengen hinzuweisen. Dieselben liegen ebenfalls fast überall in Tälern, abgesehen vom äussersten Norden des Landes, wo die jährliche Niederschlagsmenge zum Teil noch wenig über 700 mm steigt. „Je ausgesprochener die Lage eines Tales im Windschatten der eigentlich regenbringenden Winde ist, um so geringer muss natürlich seine Niederschlagsmenge sein“; das zeigt sich besonders deutlich im mittleren Wallis, welches auch in unserer Karte wie in der Billwillerschen, immer noch das umfangreichste und zugleich intensivste Trockengebiet unseres Alpenlandes geblieben ist. Auf beiden Seiten von hohen Gebirgszügen umgeben und nur nach dem Genfersee hin offen, zeigt das lange Rhonetal, trotz des ansteigenden Terrains, eine talaufwärts bis Sierre immer mehr abnehmende Regenmenge. Letztere erreicht hier und noch etwas mehr aufwärts gegen Grächen den überhaupt geringsten Betrag des ganzen Landes *), nämlich wenig über 500 mm (Grächen 528, Sierre

*) Diese überaus geringen Niederschlagsmengen, die oft in einzelnen Jahrgängen 500 mm nicht erreichen, sind von besonderer wirtschaftlicher Bedeutung und haben im Verein mit den hohen Sommertemperaturen des Mittelwallis schon sehr frühe der Bevölkerung die Errichtung von künstlichen Bewässerungsanlagen nahegelegt. So ist anzunehmen, dass die ältesten Bewässerungskanäle, z. B. die bekannte „Heidenleitung“ in Visperterminnen, römischen Ursprungs sind. Diese sogenannten „Wasserfuhren“ oder „Bisses“, wie sie im

571 $^{m}/_{m}$) und nimmt erst weiter oben, gegen das Talende hin, wieder rascher zu (Brig 709, Reckingen 1100 und Oberwald bei Gletsch 1550 $^{m}/_{m}$). In den südlichen Seitentälern bleibt diese mittlere jährliche Niederschlagshöhe immer noch verhältnismässig recht gering, im hintern Zermattal erreicht sie noch kaum 700 $^{m}/_{m}$, während beiderseits davon die noch höhern Passlagen am grossen St. Bernhard und am Simplon mit nahezu 1300 $^{m}/_{m}$ figurieren. Erst am Südhang der markigen Berneralpen zeigt die Niederschlagsmenge dann wieder ihre natürliche stärkere Anschwellung.

Ein zweites bekanntes Minimalgebiet finden wir im Unterengadin, und nirgends wohl zeigt sich die austrocknende Wirkung hoher und massiger Gebirgsketten, wie es Hann schon wiederholt an a. O. nachdrücklich angeführt hat, auf die Regenwinde besser als hier. Im Inntal nimmt die Regenmenge von der Maloja mit etwa 1000 $^{m}/_{m}$ talabwärts sukzessive bis zur Landesgrenze ab. Wir erhalten für: Sils-Maria 973, Bevers 838, Zernez 637, Schuls 654, Remüs 628 und Martinsbruck 638 $^{m}/_{m}$.

Nur kurz berühren wir an dieser Stelle die so interessanten und praktisch wichtigen Schwankungen der Niederschlagsmengen innerhalb unserer 40jährigen Normalperiode; letztere erfolgen nach Gesetzen, die wir noch gar nicht kennen; auch ist die vorliegende Beobachtungsperiode viel zu kurz, um für jene, besonders in wirtschaftlicher Beziehung so bedeutungsvollen Oszillationen irgendwelche allgemeinere Resultate herleiten zu können. [1])

In Genf, mit der längsten homogenen Reihe seit 1826, schwankte die Jahresmenge zwischen 524 $^{m}/_{m}$ (1832) und 1258 $^{m}/_{m}$ (1841), das ist zwischen 127 und 53 Prozent des Mittelwertes. Das nässeste Jahr hat demnach mehr als doppelt soviel Niederschlag, wie das trockenste. Der ganze Nordfuss der Alpen weist zwischen 1864 und 1903 ähnliche Schwankungen auf (z. B. Zürich mit 737 $^{m}/_{m}$ [1865] und 1988 $^{m}/_{m}$ im Jahre 1876), während die Südseite noch schärfere Extreme ergibt; die Niederschlagsmenge des nässesten Jahres kann dort die dreifache derjenigen des trockensten betragen (z. B. für Lugano schwankte die Niederschlagsmenge innerhalb der 40jährigen Beobachtungsperiode zwischen 829 $^{m}/_{m}$ im Jahre 1870 und 2663 $^{m}/_{m}$ im Jahre 1896). Für unmittelbar praktische Zwecke mögen diese allgemeinen Daten genügen.

Über das Verhalten der Maximalregen innerhalb eines Tages und noch kürzerer Zeiträume werden sich in der bereits genannten Spezialarbeit „Das Klima der Schweiz“ einlässliche Zusammenstellungen finden; an dieser Stelle sei nur bemerkt, dass für die überhaupt grössten Tages-, Stunden- und Minutenbeträge in unserem Lande nachstehende extremste Fälle bis jetzt zur Aufzeichnung gelangten:

Als Tagesmaxima (innerhalb 24 Stunden):

St. Gotthard	27. September	1868	280 $^{m}/_{m}$	Bernhardin	28. September	1868	254 $^{m}/_{m}$
St. Gallen	1. „	1881	250 „	Russo u. Borgnone (Tessin)	2. August	1902	je 245 $^{m}/_{m}$.

Als grösste Stundenbeträge sind bekannt:

Sihlwald b/Zürich	25. Juli	1887	in 90 Minuten	125 $^{m}/_{m}$	pro Stunde	83 $^{m}/_{m}$
Heiden [2]) . . .	26. „	1895	in 70 „	72 „	„ „	62 „
Basel	14. „	1893	in 55 „	53 „	„ „	58 „

Endlich als grösste Minutenbeträge kommen vor:

St. Gallen . . .	25. Juni	1888	in 2 Minuten	8,9 $^{m}/_{m}$	pro Minute	4,45 $^{m}/_{m}$
Basel	28. Juli	1896	in 5 „	22,3 „	„ „	4,46 „

französischen Landesteil heissen, die grösstenteils für die Bewässerung der beiderseitigen Hänge des Haupttales dienen, entnehmen ihr Wasser fast ohne Ausnahme den Seitenflüssen der Rhone; damit jedoch im Rhonetal da und dort bis auf etwa 1800 m Höhe gewässert werden kann, sind oft beträchtlich lange Zuleitungen aus den Nebentälern notwendig. Der Anfang mehrerer dieser merkwürdigen Bewässerungskanäle liegt zuweilen in ganz bedeutender Höhe, direkt am Fuss der Gletscher. So hat z. B. nach Rauchenstein (vrgl. „Zeitschrift für schweiz. Statistik“, Jahrg. 1908) die „Heidenwasser“-Leitung ihren Ursprung am Gansengletscher, beinahe 2500 m über dem Meere, die „Bergerin“ im Goms beginnt auf 2400 m am Vannigletscher, der Kanal von „Chervais“ ungefähr auf derselben Höhe, unterhalb des Grand-Désertgletschers, und der Kanal „Roh“ in Lens sogar auf 2700 m am Plaine-Mortegletscher.

[1]) Vrgl. G. Hellmann „Untersuchungen über die Schwankungen der Niederschläge“; Veröffentl. des preuss. meteorol. Instituts, Abhandlungen Bd. III, No. 1.

[2]) Von $7^{h}\,20^{m}$ bis $7^{h}\,30^{m}$ abends ca. 50 $^{m}/_{m}$.

Regenkarte der Schweiz

Basierend auf 40 jährigen Mittelwerten (1864–1903.)

Entworfen von J. Maurer.

Nr. 7.

Uebersicht der im Jahre 1908 von der Meteorologischen Zentralanstalt ausgeführten aërologischen Arbeiten (Registrier- und Pilotaufstiege)

von *Dr. A. de Quervain.*

Die aërologischen Arbeiten bestanden auch in diesem Jahr hauptsächlich in der Ausführung von Registrier- und Pilotaufstiegen. Die erstern fanden ausschliesslich an internationalen Terminen statt. Ihre Zahl betrug diesmal nicht mehr als sieben, und zwar im Wesentlichen aus dem Grund, weil das Ballon- und Instrumentenmaterial für die Föhnaufstiege zurückgehalten wurde, die für dieses Jahr vorgesehen waren. Doch konnte der Plan nicht ausgeführt werden, da keine hinreichend typischen Fälle eintraten.

Dagegen wurde den Pilotaufstiegen um so mehr Aufmerksamkeit und Arbeit gewidmet; namentlich gelangen einige längere interessante Aufstiegsserien. Andere Aufstiege bezweckten eine Kontrolle der Vertikalgeschwindigkeit der Pilotballons.

Bei der Technik der Aufstiege ist zu erwähnen, dass nach einem befriedigenden Probeversuch vom Juni an fast nur mehr russische Pilotballons zur Verwendung gelangten, von der Russian-American Caoutchouc Company in St. Petersburg. Wir gebrauchten Ballons von 73 gr Gewicht, zum Preise von 3,50 Fr., der später auf 1 Rubel = 2,66 Fr. erniedrigt wurde. Diese Piloten erreichen wesentlich grössere Höhen, 8000—10000 m und verhalten sich viel gleichmässiger als die 5 Fr. Ballons von Paturel, so dass ihre „Entdeckung“ und Einführung von grossem Vorteil war. Von derselben Fabrik bezogen wir auch einige Registrierballons, von 0,5 $^{m}/_{m}$ Dicke des Kautschuks und einem Gewicht von 2100 gr, während die gleichzeitig noch verwendeten Continental-Ballons desselben Preises (75 Fr.) 1400 gr. wiegen. Diese russischen Registrierballons gaben befriedigende Resultate, wenngleich nicht so besonders vorzügliche, wie nach den Pilotballons erwartet wurde. Die mittlere Höhe der Aufstiege betrug 15140 m, wobei ein Aufstieg mit einem alten Ballon ausser Betracht gelassen wird.

Von den Registrierinstrumenten ist schliesslich keines verloren gegangen. Allerdings wurde Nr. 102, das am 3. April 1908 aufgestiegen war, erst am 24. Juni 1909 auf der Alp Gheist im Kt. Glarus wiedergefunden; die Registrierung war noch auswertbar. An Stelle dieses für verloren gehaltenen Instrumentes wurde Bosch Nr. 269 gekauft, mit Bimetallthermometer, Bourdon-Aneroid und Haarhygrometer.

Im Juli wurde ein zweiter Spezialtheodolit zu Ballonanvisierung von Bosch angeschafft; zunächst zur Verwendung bei Parallelaufstiegen von zwei Punkten aus, namentlich für die geplanten Föhnaufstiege; aber auch für Kontrollmessungen der Vertikalgeschwindigkeiten von Pilotballons. Solche Messungen wurden in verschiedener Weise ausgeführt. 1. Zweimal (10. und 11. Juli) wurden mit zwei Theodoliten zwei verschiedene gleichzeitig aufgestiegene Piloten anvisiert. Es stand damals durch das Entgegenkommen von Herrn V. de Beauclair neben dem de Quervainschen Spezialtheodoliten auch der diesem nachgebildete, nach Assmanns Anweisungen von Bunge in Berlin konstruierte Theodolit zur Verfügung. Doch erwies sich dieser als ungenügend, indem bei der einen Messungsreihe der Ballon schon bei 7000 m Höhe verschwand, während er im erstern Instrument bis 10000 m verfolgt werden konnte. Beim zweiten Aufstieg platzten beide Ballons schon zwischen 2500 und 3500 m (das einzige Mal, wo ein so frühes Versagen bei den russischen Pilotballons vorkam!). Wegen Mangels an Hülfskräften und dem Eintreten ungünstiger Witterung konnten diese Versuche nicht weiter ausgedehnt werden. Sie ergaben im Mittel aus 16 Einzelmessungen für 500 m-Stufen eine mittlere Differenz der Richtungen von 2—3° und der Geschwindigkeiten von 5—6 %. 2. Am 27. und 28. Juli wurde ein Pilotballon mit einem besondern Theodoliten gleichzeitig mit dem Registrierballon anvisiert. Die Windverhältnisse, namentlich am zweiten Tage, waren aber dem Versuche nicht günstig. Die mittlere Geschwindigkeit der Luftströmung bis zu 3000 m ergab sich beim ersten Aufstieg nach Registrier- und Pilotballon zu 3.87 und 3,76 m, bis zu 6000 m gleich 5,25 und 4,93 m. Beim zweiten Aufstieg waren die Zahlen bezüglich bis 3000 m 1,20 und 1,29 m und bis 6500 m 1.77 und 1.57 m. 3. Endlich wurden, nach einem Vorversuch am 9. Dezember, am 14. Dezember von zwei 3018 m entfernten Punkten (Dach der Zentralanstalt–Waidberg) die Flugbahn einiger Pilotballons mit zwei Theodoliten gleichzeitig verfolgt. Auch hier war die Witterung zur Ausdehnung der Messungen auf grössere Ballonhöhen nicht günstig; dazu war auch die Basislänge, resp. die mögliche Genauigkeit der Kreisablesung nicht hinreichend.

Es ergaben sich folgende Resultate für die Vertikalgeschwindigkeit V in den einzelnen Höhenstufen, bei den vier von 1^{h} 35 bis 4^{h} 35p aufeinander folgenden Aufstiegen:

Auftrieb 0,200 kg						Auftrieb 0,150 kg	
1) Höhenstufe	V	2) Stufe	V	3) Stufe	V	4) Stufe	V
0— 213 m	3,55 m	0— 220 m	3,66 m	0— 218 m	3,63 m	0— 380 m	3,16 m
213— 646	3,61	— 415	3,46	— 604	3,22	— 775	3,29
646—1018	3,11	—1668	3,48	—1294	3,83	—1142	3,06
		—2070	3,49	—1658	3,25	—1516	3,11
		—2440	3,23	—2060	3,14	—1865	2,91
		—2820	3,18	—2455	3,29	—2202	2,86
		—3210	3,23	—3057	3,34	—2539	2,81
		—3600	3,25	—3522	3,87	—2888	2,90
		—4000	3,33			—3264	3,13
		—4198	3,30				
0—1018 m	3,40	0—4198 m	3,33	0—3522 m	3,45	0—3264 m	3,02

Aus diesen Messungen geht hervor, dass die im Vorjahr aus den Versuchen im geschlossenen Raum (Grossmünster) abgeleitete Vertikal-Geschwindigkeitsformel $V = 5{,}70 \sqrt[3]{A}$ auch für Höhen bis zu 4000 m gilt (für Auftrieb A = 0,200 kg und 0,150 kg ergibt sich nach der Formel V zu 3,33 und 3,03 m), dass aber in den verschiedenen Schichten nicht unerhebliche Schwankungen vorkommen; diese sind wahrscheinlich auf vertikale Bewegungskomponenten der Luftströmung zurückzuführen.

Die Resultate aller an den internationalen Terminen angestellten Beobachtungen werden 1½ bis 2 Jahre später in der betreffenden internationalen Veröffentlichung fortlaufend publiziert. Einige Resultate von Pilotballonserien dieses Jahres finden sich auch von mir mitgeteilt in den Verhandlungen des internationalen geographischen Kongresses in Genf und der Jahresversammlung der Schweizerischen Naturforschenden Gesellschaft in Glarus (Verhandlungen 1908, Bd. I S. 287) und Archives des sciences phys. et nat., Genève, t. XXVI octobre 1908.

Nähere Umstände der einzelnen Aufstiege und Besonderheiten der Registrierung und der Flugbahn.

Pilotaufstiege vom 4.—8. Februar (internationaler Termin 6. Februar). Ein Hochdruckgebiet lag im Westen und Nordwesten; eine tiefe Depression breitete sich von Norden nach Südosten aus. Bemerkenswert ist am 4. Februar die grosse Stärke und Höhenerstreckung der unten kaum merklichen Nordost-Strömung, am 8. die NNW-Richtung.

Pilotaufstiege vom 11.—15. Februar. Nach einer Unterbrechung durch zwei bedeckte Tage schliessen diese Aufstiege an die vorhergehenden an, immer noch im selben Hochdruckgebiet. Die anfänglich nördliche Strömung, bedingt durch die verschwindende Depression im Osten, wird zuerst in grössern Höhen ersetzt durch eine Südströmung, die in Beziehung steht zu einer von Westen kommenden Depression. Der eigentümliche Uebergang, mit scharfen Windsprungschichten, ist an den zahlreichen Aufstiegen gut zu verfolgen. Linksdrehung mit der Höhe!

Pilotaufstiege vom 2.—6. März (internationaler Termin 5. März). Diese Serie, aus prognostischem Interesse begonnen, mit Rücksicht auf die auffallende, der Wetterlage scheinbar nicht recht entsprechende Aufklärung am 2. März. Beachtenswert an diesem Tag der untere seichte Ostwind und die in 3500 m (Alpenkamm?) scharf einsetzende SSW-Strömung.

Pilotaufstieg vom 24. März. Probeversuch mit russischem Pilotballon.

Internationaler Termin vom 1.—3. April. Am 1. und 2. April zu ungünstiges Wetter.

Am 3. April: 1. Registrieraufstieg. 8^h 03a von Schlieren aus. Instrument Nr. 102 mit 3 Lamellenthermometern (A gewöhnlich montiert, B und C geschwärzt, ohne Strahlungsschutz ausserhalb des Körbchens, wovon B flach und horizontal, C zylindrisch gekrümmt und senkrecht stehend). Gummiballon von 1900 $^m/_m$ Durchmesser mit Pilot und Fallschirm. Auftrieb 2700 gr. Witterung: Bedeckt, Altocumulusschicht, in welcher der Ballon nach 9^m 50^s verschwindet, der Visierung zufolge in 2450 m beginnend. — Landung auf der Alp Gheist oberhalb Schwanden, Kt. Glarus, in ca. 1600 m Höhe, 66 km, E 42 S. Mittlere Geschwindigkeit unbekannt, da Uhrwerk stehen blieb. Auffindung erst am 24. Juni 1909; daher Registrierung nicht mehr ganz auswertbar. Besonderheiten: In 560 m bei A Beginn einer Inversion (1.9, 2.6, 2.7). In 890 m: Maximum der Inversion bei A (3.1, 2.2, 2.0). In 2600 m Beginn einer Inversion (–8.7, –7.8, –8.2). In 2880 m Maximum der Inversion bei den Strahlungsthermometern (–7.1, –4.9, –5.6). In 7520 m Gradient wird sehr stark (–35.8, –33.5, –34.6). In 8720 m Gradient wird schwächer (–47.4, –46.0, –45.1). In 11260 m Beginn der obern Inversion? (–60.0, –56.5, –?). In 12190 m Uhrwerk von hier an gehemmt, Registrierung weiterhin nicht auswertbar (–57.4, –50.6, –52.4).

2. Bemannter Ballonaufstieg.[1]) 9^h 52a von Schlieren aus. Führer Dr. A. de Quervain, Beobachter Dr. R. Billwiller und Dr. A. de Quervain. Ausserdem noch zwei andere Mitfahrer. Zwischenlandung 4^h 10p bei Weilheim südlich des Ammersees. Landung 6^h 15p bei Thalham (Schliersee). 255 km. Mittlere Richtung nach E 10 N. Grösste Höhe 3282 m, tiefste Temperatur dort —9°2. Die Fahrt sollte womöglich die Nacht hindurch fortgesetzt werden, die stark wechselnde Bewölkung machte aber den Ballast vorzeitig zu Ende gehn.

Registrieraufstieg vom 4. April. 9^h 51a. Instrument Nr. 53. Gummiballon 1500 $^m/_m$, Auftrieb 3320 gr. Witterung: A-Str, A-Cu, Fr-Ni, zeitweilig Regentropfen. Landung in Balterswyl bei Eschlikon, 30 km E 17 N. Dauer 31^m 05^s, mittlere Geschwindigkeit 16,1 m. Besonderheiten: 1530 m Vertikalgeschwindigkeit nimmt vorübergehend ab. 2800 m relative Feuchtigkeit 76 %, Maximum. 3340 m –16.4, Beginn einer Isothermie. 6030 m Ballon platzt.

Pilotaufstiege vom 15.—17. April. Zur Untersuchung von Richtung und Mächtigkeit des Ostwindes, und (15.) Beziehung zu Richtung der Cu-N Cirrusschirme. Am 15. noch Ostwind bis 8500 m, am 16. bei ziemlich unveränderter Wetterlage (Hochdruck im Norden, Tiefdruck im Süden) Ostwind bis 7000 m, darüber scharf einsetzend Westwind! Am 17. ähnlich wie am 16., nur sowohl Ost- wie Weströmung schwächer; eine Depression bricht von NE her ein.

Pilotaufstiege vom 18.—22. Mai. Angefangen zur Untersuchung der Bisenmächtigkeit, fortgesetzt mit Rücksicht auf die von Westen kommende Teildepression. Beachtenswert die am 21. abends zuerst in tiefern Schichten einsetzende Linksdrehung. Am 22. drei Aufstiege zur Sondierung des um Mittag sehr stark wehenden Föhns und dessen Unterlagerung durch Nordwind am Abend, als Einleitung des grossen Temperatursturzes. Vergl. die Arbeit von Dr. R. Billwiller in diesem gleichen Band (Anhang No. 1).

[1]) In Verbindung mit dem Schweizerischen Aeroklub.

Pilotaufstiege vom 30. Mai bis 5 Juni. Angefangen zur Untersuchung, wieweit der hohe Ostwind des Vortages (Depression im Süden) mit der Aenderung der Druckverteilung (nur Teildepression über Deutschland, Hauptdepression im SW) sich ändert. Wird ganz durch SW ersetzt! Am Abend des 30. bemerkenswerte Unterlagerung von E-Wind. Am 2. und 3. ist Unterlagerung eines immer mächtiger werdenden E- bis NE-Windes mit scharf einsetzendem S bis W darüber eigentümlich.

Pilotaufstiege vom 11.—13. Juni (internationaler Termin 11. Juni). Vom 11. auf den 12. dreht die ganze Strömung von N nach W mit einer charakteristischen Einschaltung einer WNW-Schicht am 12.

Pilotaufstiege vom 16.—19. Juni. Angefangen zu prognostischem Zweck. Höhe des SE-Windes? Am 18. die seichte Nordostströmung unter SW (Beziehung zu 2 Depressionsgebieten?) beachtenswert.

Pilotaufstiege vom 25. Juni bis 4. (7.) Juli (internationaler Termin 2. Juli). Zur Untersuchung der Höhenerstreckung der Bise mit Rücksicht auf die unter Führung von Herrn V. de Beauclair geplante Alpenüberquerung im Ballon (ausgeführt am 29.). Auffallend am 26. und 29. Juni das scharfe Einsetzen von NNW-Wind etwa in Alpenkammhöhe, ebenso von WNW- bis W-Wind am 30. Juni und 1. Juli in grösserer Höhe, von ca. 6 km. Der zweite Aufstieg vom 1. Juli ausgeführt mit Rücksicht auf die Fahrt des $2^h 40^p$ Zürich passierenden Zeppelin'schen Luftschiffs. Am 2. und 3. beachtenswert der graduelle Uebergang von NE- in NW-Wind. Am 4. und 7. Juli NW-Winde in der Höhe; zu beziehen auf Depression im NE.

Pilotaufstiege vom 10. und 11. Juli. Doppelaufstiege zum Vergleich der Vertikalgeschwindigkeiten. S. oben bei den allgemeinen Bemerkungen.

Internationale Serienaufstiege vom 27. Juli bis 1. August.

Registrieraufstieg am 27. Juli, $7^h 38^a$. Instrument Nr. 50. Ballontandem 1900 $^m/_m$ (altes Exemplar) und 1500 $^m/_m$. Auftrieb 3450 gr. Witterung: Heiter. Flugbahn des Ballons mit Theodolit bis in den Abstieg verfolgt. Gleichzeitig Pilotballon anvisiert bis 7500 m. Landung in Gamliken bei Stallikon in 8,8 km S 31 W. Dauer $28^m 20^s$. Mittlere Geschwindigkeit 5,2 m (nach Visierung 5,6 m). Besonderheiten (nur Rohrthermometer hat registriert): 630 m Inversion beginnt (14,9). 1200 m Maximum der Inversion (16,4). 1730 m und 2200 m relative Feuchtigkeit 69% und 83%. 3380 m Gradient wird sehr klein (–1,6). 4480 m Ballon platzt. — Pilotaufstieg $5^h 45^p$ bis 11800 m.

Registrieraufstieg am 28. Juli, $7^h 35^a$. Instrument 269. Gummiballontandem (2 russische Ballons von je 2100 gr Eigengewicht). Auftrieb 2980 gr. Witterung: heiter. Ballon bis zur grössten Höhe anvisiert. Gleichzeitig Pilotballon bis 7000 m. Besonderheiten: 3640 m Gradient wird stark (0.9), relative Feuchtigkeit nimmt stark zu. 3900 m Beginn einer Isothermie (–2.0), 13110 m Minimum der Temperatur (–62.0), 15770 Ballon platzt. — $11^h 33^a$ und $5^h 34^p$ Pilotballonaufstiege bis 2850 und 2000 m.

Registrieraufstieg vom 30. Juli, $9^h 45^a$. Registrierinstrument Nr. 50. 2 Thermometer, B = Bimetallthermometer, R = Rohrthermometer. Einzelner Ballon von 1500 $^m/_m$ mit 2580 gr Auftrieb. Witterung: ziemlich bedeckt, Str-Cu. Ballon mit Theodolit 9 min anvisiert. „Landung" im Hallwyler See bei Beinwil, 28 km W 25° S. Dauer ca. $1^h 45^m$. Mittlere Geschwindigkeit 4,4 m. Besonderheiten: In 960 m relative Feuchtigkeit 90% Maximum. In 1190 m Beginn einer Inversion (13.1, 14.9). 1360 m Maximum Rohrthermometer (16.9, 17.5). 1500 m Maximum des Bimetallthermometers. 4830 m (–4.7, –5.9) Gradient wird kleiner. 5800 m (–10.1, –10.5) Gradient wird stärker, Minimum der relativen Feuchtigkeit, 37%. 6740 m (–18.1, –18.8) bis 7000 m Isothermie bei Rohrthermometer. 7890 m (–23.5, –24.6) Zunahme des Gradienten. 12160 m Beginn grosser Isothermie (–54.7, –57.2). 13160 m (–55.3, –56.8) Beginn grosser Inversion. 13940 m (–53.3, –53.4) Uhr bleibt stehen. 18000 m Ballon platzt. — Pilotaufstieg $5^h 28^p$ bis 11400 m.

Registrieraufstieg vom 31. Juli, $7^h 13^a$. Instrument Nr. 53. Einzelner Ballon (Russe, 2100 gr), Auftrieb ca. 2500 gr. Witterung: heiter. Anvisiert bis zur grössten Höhe. Landung in Udligenswil bei Küssnacht (Kt. Luzern), in 30,3 km S 19 W, Dauer ca. $1^h 18^m$, mittlere Geschwindigkeit ca. 6,5 m. — Besonderheiten: Von 740 m an Feuchtigkeitsabnahme (91%, 15.6). 1420 m Minimum der Feuchtigkeit, 63%. 2170 m sekundäres Maximum der relativen Feuchtigkeit (79%, 9.8). 3520 m (1.8) Gradient nimmt zu. In 4200 m (–3.7, 61%) wird Gradient kleiner, relative Feuchtigkeit beginnt stark abzunehmen. In 6370 m Gradient wird etwas kleiner, Minimum der Feuchtigkeit (–15.1, 38%). In 13330 m Beginn der obern Inversion (–67.0). 18290 m (–54.0) Ballon platzt.

Internationale Serienaufstiege vom 30. September bis 2. Oktober.

Pilotaufstiege am 29. und 30. September.

Registrieraufstieg am 1. Oktober, $8^h 40^a$. Instrument 269. — Witterung: heiter, Fr.-Str. aus NE. Ballon anvisiert bis in den Abstieg. Gleichzeitig Pilotballon, bis 12300 m. Landung in Ludiswil bei Römerswil (Kt. Luzern), in W 40 S, 45 km. Dauer $52^m 45^s$. Mittlere Geschwindigkeit 13.8 m. Besonderheiten: 790 m (9.7, 100%) Beginn einer Inversion. 1310 m (14.9) Maximum der Inversion. In 2390 m (12.0, 8%) Feuchtigkeit scharfes Minimum, Gradient wird etwas stärker. In 2900 m (7.4, 17%) Gradient wird etwas kleiner, Feuchtigkeit sekundäres Maximum. In 4550 m (–3.°1, 3%) Minimum der relativen Feuchtigkeit. Von 7520 m (–25.5) bis 7840 m (–27.0) Gradient etwas schwächer, nur 0.48. In 10370 m Höhe platzt der Ballon. — Pilotaufstieg 1. Oktober, $4^h 58^p$ bis 13250 m.

Pilotaufstiegsserie vom 2. Oktober (29. September) bis 17. Oktober im Anschluss an die internationalen Aufstiege, zunächst zur Untersuchung des Ostwindes und schliesslich mit der Absicht eine möglichst lange ununterbrochene Reihe zu bekommen. Die Aufstiege liegen alle im Bereich einer antizyklonalen Situation. Die Serie enthält manches Merkwürdige und zum Teil nicht ohne Weiteres Erklärliche, das eine besondere Untersuchung verlangt. Hier seien nur einige unmittelbar auffällige Punkte genannt. Die drei ersten Aufstiege zeigen den schon in verschiedenen frühern Fällen gefundenen Typus des linksdrehenden mit der Höhe an Stärke zunehmenden nordöstlichen Windes. Beim 1. Oktober, $4^h 58^p$ ist dann ungewöhnlich die in 8500 m einsetzende Rechtsdrehung. Der 2. Oktober zeigt wiederum einen bekannten Typus, hochreichenden NNE-Wind. Am 3. Oktober auffällig das Umlaufen des Windes durch 360°, oben im Bisentypus endigend. Die West- und Nordströmung des 4. und 5. Oktober ist in Beziehung zum Tiefdruckgebiet im Norden, resp. Nordosten zu setzen. Die SW- und NW-Strömungen vom 7. und 8. Oktober können, wenn auch weniger gut, auch in solche Beziehung gesetzt werden. Die Strömung vom 9. Oktober steht merkwürdigerweise nicht zum Minimum im NW, sondern zum weniger ausgeprägten Tiefdruck über dem westlichen Mittelmeer in Beziehung. Die drei Aufstiege vom 10., 11., 12. Oktober stellen mit ihren Uebergängen von SW in SE (ungewöhnliche Linksdrehung!), NE in SE, NE in S, dann E (hier also ungewöhnliche Rechtsdrehung), ebensoviele neue und aus der untern Luftdruckverteilung zunächst kaum erklärliche Typen dar. Der 15. Oktober bringt den schon bekannten scharfen Uebergang von NE- zu NW-Wind in Alpenkammhöhe. Der 16. und 17. zeigen NW-Strömungen in der Höhe. An allen drei Tagen erscheint es gewagt, die untere Luftdruckverteilung ohne weiteres zur Erklärung heranzuziehen. —

Internationaler Termin am 5. November. In Zürich bedeckt; kein Aufstieg.

Pilotaufstieg am 3. Dezember, (internationaler Termin). Nordwestströmung; tiefe Depression im NE. — Pilotaufstieg am 9. Dezember. Vorversuche für Messung von zwei Punkten aus.

Pilotaufstiege am 14. Dezember. Vier Aufstiege mit Bahnbestimmung durch zwei Theodoliten. Siehe unter den allgemeinen Bemerkungen.

Nr. 8.

Die Erdbeben der Schweiz im Jahre 1908

und die Schallverbreitung der Dynamitexplosion an der Jungfraubahn, 15. November.

Nach den von der schweizerischen Erdbebenkommission gesammelten Berichten bearbeitet und ergänzt

von

Dr. A. de Quervain in Zürich.

(Mit einer Tafel.)

Mitglieder der schweiz. Erdbebenkommission pro 1907.

(1–4 zugleich Ortsausschuss.)

1. Hr. Prof. Dr. J. Früh in Zürich, Präsident.
2. » Prof. Dr. A. Heim in Zürich, Vizepräsident.
3. » Privatdozent Dr. A. de Quervain in Zürich, Schriftführer.
4. » Dr. J. Maurer, Direktor der meteor. Zentralanstalt in Zürich.
5. » Prof. Dr. A. Forster in Bern.
6. » Forstinspektor Ad. de Werra in Siders.
7. » Prof. Dr. Cl. Hess in Frauenfeld.
8. » Prof. Dr. A. Riggenbach in Basel.
9. » Apotheker C. Bührer in Clarens.
10. » Prof. Dr. H. Schardt in Neuchâtel.
11. » Prof. Dr. Ch. Tarnuzzer in Chur.
12. » Prof. Dr. Ch. Sarasin in Genf.
13. » Prof. Dr. F. A. Forel in Morges.
14. » Prof. J. Meister in Schaffhausen.
15. » Prof. Dr. Raym. de Girard in Freiburg.

Vorbemerkung. Zur Ergänzung des oben genannten Materials wurde benützt: 1. Die Erdbebenbeobachtungen der schweiz. meteorologischen Stationen, exzerpiert aus den Tabellen durch die Herren Mettler und Weber. 2. Der wöchentliche makroseismische Erdbebenbericht der Hauptstation für Erdbebenforschung zu Strassburg. (Die „neuesten Erdbebennachrichten“ der Monatschrift „Erdbebenwarte“ von A. Belar, Laibach, lagen bis zur Zeit der Abfassung nicht vor.) 3. Auskünfte des seismologischen Observatoriums von München (Herr Dr. Messerschmitt), der meteorologischen Zentral-Institute von Baden, Württemberg und Italien, ebenso die Erdbebenangaben des italien. meteorolog. Bulletins. 4. Eine Anzahl nachträglich durch den Berichterstatter bei den Beobachtern eingezogener Auskünfte.

Die Zeitangaben beziehen sich überall auf mitteleuropäische Zeit.

Intensitätsskala. Für die Beurteilung der Stärke der Erdstösse wurde wie früher die Rossi-Forel'sche oder italienisch-schweizerische Intensitätsskala zu Grunde gelegt. Sie lautet:

Nr. 1. Mikroseismische Bewegung, notiert von einem Seismographen oder von mehreren Instrumenten derselben Art, aber nicht im stande, Seismographen verschiedener Konstruktion in Funktion zu versetzen. Konstatiert von einem geübten Beobachter.

„ 2. Stoss, registriert von Seismographen verschiedenen Systems, konstatiert von einer kleinen Anzahl im Zustande der Ruhe befindlicher Beobachter.

„ 3. Erschütterung, beobachtet von mehreren Personen in der Ruhe; stark genug, dass Dauer oder Richtung geschätzt werden können.

„ 4. Erschütterung, beobachtet von Personen in Tätigkeit; Erschütterung beweglicher Objekte, der Fenster, Türen; Krachen der Dielen.

„ 5. Erschütterung allgemein von der ganzen Bevölkerung bemerkt; Erschütterung grösserer Gegenstände, der Möbel, Betten; Anschlagen einzelner Hausglocken.

„ 6. Allgemeines Erwachen der Schlafenden; allgemeines Anschlagen der Hausglocken, Schwanken der Kronleuchter, Stillstehen von Uhren, sichtbares Schwanken der Bäume und Gesträucher. Einzelne Personen verlassen erschreckt die Häuser.

„ 7. Umstürzen von beweglichen Gegenständen, Ablösen von Gipsstücken aus der Decke und von den Wänden, Anschlagen von Kirchenglocken, allgemeiner Schrecken, noch keine Beschädigung der Bauwerke.

„ 8. Herabstürzen von Kaminen, Risse in den Mauern von Gebäuden.

„ 9. Teilweise oder gänzliche Zerstörung einzelner Gebäude.

„ 10. Grosses Unglück, Ruinen, Umsturz von Erdschichten, Entstehen von Spalten in der Erdrinde, Bergstürze.

Erdbeben im Jahre 1908.

Das Jahr 1908 war in der Schweiz seismisch sehr ruhig; im ganzen wurden nur 12 zeitlich getrennte Erderschütterungen beobachtet. Sie verteilen sich folgendermassen auf die einzelnen Monate:

I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII
2	—	1	—	3	—	—	—	—	—	1	5

Hievon entfallen 9 auf die Zeit der relativen Ruhe des Menschen (8 p — 8 a), 3 auf die Zeit der relativen Tätigkeit (8 a — 8 p).

Keine einzige dieser Erschütterungen war von irgend erheblicher Intensität, und mit Ausnahme der am 28. Dezember an einigen Orten gespürten Ausläufer (?) des Erdbebens von Messina waren sie alle ganz lokal beschränkt. Die meisten Erschütterungspunkte lagen in der Westschweiz. Das graubündnerische Gebiet hat sich dies Jahr fast ganz still verhalten.

Es sei erwähnt, dass von dem im letzten Jahr durch Dr. E. Dietz in Davos aufgestellten Bosch'schen Erdbebenpendel einige publizierte Angaben, allerdings nur vom 15. Dezember 1907 bis 15. Januar 1908, vorliegen. Soweit wir in Erfahrung bringen konnten, trat der Apparat später ausser Funktion.

Während die Erdbebenerscheinungen ohne Bedeutung waren, erscheint um so interessanter ein in diesem Jahr eingetretenes Phänomen verwandter Art, über das auf Seite 3 ausführlich berichtet ist, nämlich die eigentümliche Schallverbreitung der Dynamitexplosion an der Jungfraubahn.

---

1. Am 20. Januar, kurz vor 1^h morgens, wurde in La Chaux-de-Fonds von mehreren in der untern und mittlern Stadt Wohnenden ein einzelner Stoss verspürt. Prof. H. Schardt schreibt darüber: „Es handelt sich wahrscheinlich um ein Einsturzbeben; denn jene Juragegend ist in der Tiefe stark ausgehöhlt durch unterirdische Gewässer, die sich in den Hohlgängen der obern jurassischen Kalke sammeln, und die grossen Quellen speisen, die bei Biaufond sich in den Doubs ergiessen."

2. Am 29. Januar, um $10^h 30$ vormittags, wurde im Hospiz des Grossen St. Bernhard von allen dort befindlichen Personen ein Erdbeben verspürt, gefühlt als ein etwa 3 Sekunden dauerndes, rollendes Geräusch, von den einen nicht als eigentlicher Stoss empfunden und von allen zuerst als Lawinenwirkung gedeutet. Auch ein auf der Schweizer Seite eine Stunde vom Hospiz sich befindlicher Skiläufer spürte das Erdbeben; nicht beobachtet wurde es auf der italienischen Seite in der $^1/_2$ Stunde vom Hospiz entfernten Kantine.

3. Am 9. März, um $5^h 37$ nachmittags, wurde im obern Teile des Tales von Ormont (Gebiet der Diablerets, Kt. Waadt), von einigen Personen, die dort ein Chalet bewohnen, eine Erderschütterung verspürt, wellenförmig, 2—3 Sek. dauernd, scheinbar von West nach Ost laufend. Einem Herrn, der schon unwohl war, ist bei der Erschütterung so übel geworden, dass er sich zu Bett legen musste; ein Kind hat ängstlich die Hand einer erwachsenen Person ergriffen. Der Bericht erstattende Beobachter dachte zuerst, es könnte die Schneelast vom Dach gefallen sein. Stärke III.

4. Am 23. Mai, um $4^h 16$ morgens, wurde in Clarens (Waadt), Herr C. Bührer durch das Krachen des Zimmers aufgeweckt und glaubte eine wellenförmige Bewegung zu spüren. Er hält eine Täuschung für möglich, besonders da anderweitige Bestätigungen fehlen. Es wäre Stärke III anzunehmen. Vielleicht ist eine Notiz des italienischen Bolletino meteorico heranzuziehen: Um $4^h 19$ a Registrierung eines benachbarten Bebens in Padua.

5. Am 24. Mai, um $3^h 20$ morgens, wurde in Splügen (1460 m), Kt. Graubünden, ein kurzer, scheinbar von NE nach SW gerichteter Stoss verspürt, „von ziemlich vielen Personen bemerkt". Stärke III. Gegen Abend soll noch ein leichterer Stoss beobachtet worden sein.

6. Am 24. Mai, um 8^h a, wurde im Wasserwerk Crana-Torricella bei Lugano ein etwa 4 Sekunden dauerndes Zittern der Fensterscheiben bemerkt, welches als Erdbebenerscheinung gedeutet wurde. Damit ist die Angabe des Bolletino meteorico zu vergleichen: Am 24., um $8^1/_2$—$8^3/_4$ a Erdbebenstoss in Novara (Stärke IV—V Mercalli), registriert (? „registrata") in Moncalieri bei Turin und Domodossola.

7. Am 5. November wurde um $5^h 10$ morgens in Rüschlikon (Zürichsee) einer Zeitungskorrespondenz zufolge ein deutlich fühlbarer Stoss mit nachherigem, einige Sekunden andauerndem Rollen und Zittern wahrgenommen. Unsere Bemühungen um nähere Nachrichten blieben erfolglos.

8. Am 3. Dezember, morgens $5^h 40$, wurde in St. Livres bei Aubonne (Waadt) eine starke Erschütterung beobachtet (forte détonation dans l'air; porte, fenêtre, tout tremblait dans la maison; 40 (!) secondes de durée. Die Angabe rührt von einem, vielleicht etwas unkritischen Beobachter her. Stärke III—IV.

9. Am 4. Dezember, morgens zwischen 3^h und $3^h 15$, wurde in Le Vaud s Begnin (Waadt), ein Ehepaar samt einem zugehörigen kleinen Kind durch drei rasch aufeinanderfolgende, deutlich unterschiedene Stösse aus dem Schlaf geweckt. Sie sahen sich veranlasst — ohne Erfolg — das Haus abzusuchen. Im Dorfe hatte sonst niemand etwas bemerkt. Stärke III—IV.

10. Am 12. Dezember, um $1^h 05$ und $1^h 45$ morgens, wurde in Rolle (Genfersee), von einer Person je ein leichter wellenartiger Erdbebenstoss verspürt; 40 Minuten später seien noch 4 oder 5 noch schwächere Erschütterungen erfolgt, die ungefähr von West nach Ost gerichtet schienen, während die ersten die entgegengesetzte Richtung hatten. Die Beobachterin, die an Schlaflosigkeit leidet, gibt an, in der Nacht sehr oft ähnliche, auch stärkere Erschütterungen zu empfinden: zwei Tage nach dem genannten Datum, am 14. Dezember $12^h 20$ früh morgens habe sie z. B. ein starkes Krachen ohne merkliche Erschütterung beobachtet. Stärke III.

11. Am 27. Dezember wurde gegen $11^h 15$ abends von einer einzigen Person in Neuchâtel im südwestlichen Teil der untern Stadt (Port-Roulant) ein einzelner Stoss beobachtet. Stärke II.

12. Am 28. Dezember, morgens $5^h 15$ bis $5^h 20$, je nach den Angaben, wurde ein Stoss oder eine Reihe von Erschütterungen beobachtet in Neuchâtel (Stadt), Couvet, Motiers (Val de Travers), La Chaux-de-Fonds, Les Brenets und Cortébert (Berner Jura), je von einem einzigen Beobachter. Herr Prof. H. Schardt, der vorstehende Angaben uns vermittelt hat, schreibt, dass die Originalmitteilungen sehr bestimmt lauten, so dass kaum an der Realität der Tatsache gezweifelt werden könne. Diese Beobachtungen sind von besonderem Interesse, weil sie zeitlich mit dem calabro-sizilianischen Katastrophenbeben zusammenfallen ($5^h 20$ a). Eine dahingehörende weitere ganz vereinzelt dastehende Beobachtung liegt auch vor aus Marécottes, Salvan (Unterwallis), wo eine wachend im Bett liegende Beobachterin nach 5^h morgens ebenfalls einen Stoss beobachtet hat. Diese letztere Angabe wird von Herrn Bührer als zuverlässig bezeichnet.

Die Fernwirkung der Dynamitexplosion an der Jungfraubahn am 15. November.

Obschon es sich hier nicht um ein Erdbeben im eigentlichen Sinne handelte, sind doch die Wirkungen auf einem so ausserordentlich grossen Gebiet zum Teil als solches gedeutet und sind so merkwürdige Begleiterscheinungen beobachtet worden, dass eine genaue Darstellung der Tatsachen an dieser Stelle ohne weiteres geboten erschien.

Das Merkwürdige liegt darin, dass ausser einem die Explosionsstelle umgebenden Gebiet normaler Hörweite ein zweites ausserordentlich viel ausgedehnteres Gebiet abnormaler Hörweite vorhanden war, welches vom erstern durch eine rund 100 km breite Zone des Schweigens getrennt war (vergleiche für alles Folgende die auf der Tafel gegebene Karte).

Sobald aus einer Mitteilung des meteorologischen Beobachters von St. Gallen, die zunächst an die Zentralanstalt und von dort dann in die Hände des Berichterstatters gelangte, die erste Andeutung des merkwürdigen Sachverhaltes sich ergeben hatte, wurde den Zeitungen eine Aufforderung zur Mitteilung bezüglicher Beobachtungen übergeben, eine grosse Anzahl Fragekarten an die in Betracht kommenden Höhenorte verschickt, und auch die meteorologischen Zentral-Institute von Baden und Württemberg und die Erdbebenstation von München um Mitteilung der dort etwa einlaufenden Beobachtungen ersucht, die uns denn auch gütigst zur Verfügung gestellt wurden.

Dank der sofortigen Umfrage, und namentlich der Bereitwilligkeit des Publikums, auch in ausserhalb der Schweiz gelegenen Orten, uns Nachricht zukommen zu lassen, kam so ein ziemlich umfangreiches Beobachtungsmaterial zusammen, das der Karte und der folgenden Darstellung zugrunde gelegt werden konnte. Wir besprechen zuerst die Beobachtungen im Gebiet normaler, dann im Gebiet abnormaler Hörweite. Es schien mit Rücksicht auf die Seltenheit und Seltsamkeit des Falls und im Interesse einer objektiven Darstellung angemessen, bei den einzelnen Orten die Angaben der Beobachter, wenn auch möglichst knapp, doch in den wesentlichen Punkten mit deren eigenen Ausdrücken anzuführen.

Beobachtungen im Gebiete der normalen Hörweite.

Um $10^h 45$ a explodierte aus einem unaufgeklärten Grund an der im Bau befindlichen Jungfraubahn das grosse Dynamitmagazin mit ungefähr 25 000 kg Dynamit. Dieses Magazin befand sich ca. 500 m Tunnelstrecke unterhalb der Station Eigerwand, in 2695 m Seehöhe, in einem gegen den Abgrund der Eigerwand zu offenen, nur mit Bretterwand verschalten Nebenraum des Tunnels, von diesem rückwärts durch eine etwa 20 m dicke Felszwischenwand getrennt. Die Explosion konnte also nach der Seite der Eigerwand zu ganz frei in den Luftraum hinausgehen. Die Zwischenwand gegen den Tunnel zu wurde eingedrückt und der Nebenstollen sowohl wie der Tunnel auf eine Länge von 70 m mit Gesteinstrümmern gefüllt. Auf eine etwa 700 m oberhalb der Explosionsstelle im Tunnel fahrende Lokomotive wurde keine besondere Wirkung ausgeübt. An der Station Eismeer, 3161 m, 2 km oberhalb, wurde dem Knall zunächst kaum Beachtung geschenkt! Auf der 500 m oberhalb liegenden Station Eigerwand (2868 m) wurden die ins Freie gehenden Fenster einwärts eingedrückt, ebenso an der ca. 500 m unterhalb gelegenen Station Rotstock zwei Türfüllungen.

„Nach übereinstimmenden Angaben des Personals ist die Explosion nicht auf einmal erfolgt; es wurden vielmehr zwei, nach andern sogar drei Schläge gehört." Dem entsprechen alle im Schallgebiet gemachten Wahrnehmungen. „Viel heftiger äusserte sich die Explosion am Eigergletscher, in Grindelwald und Lauterbrunnen. Das Verwaltungsgebäude und die Remise an der Station Eigergletscher (am untern Tunnelausgang, 1,5 km von der Explosionsstelle) zitterten, und die Insassen waren der absoluten Meinung, es sei ein Erdbeben erfolgt. Die Scheidegg scheint weniger berührt worden zu sein. Von den Bergen lösten sich gleichzeitig mit dem Knall einige Lawinen." (Vorstehendes nach gütigen Mitteilungen der Jungfraubahn-Verwaltung.)

Aus dem Berner Oberland sind auf hingesandte Fragekarten folgende positive Berichte eingelaufen:

Aus Grindelwald schreibt das Telegraphenbureau: „Die Telegraphenuhr zeigte $10^h 47$. Zuerst erfolgte eine Reihe schnellst aufeinanderfolgender Detonationen, denen sofort ein furchtbarer Knall folgte, worauf ein anhaltendes Widerhallen und Tosen im ganzen Gebirge. Weiter beobachtet wurde: Deutlich wahrnehmbare Erschütterung des ganzen massiven Postgebäudes, geräuschvolles Schüttern und Klirren der Türen und Fenster, Zertrümmerung selbst 8 $^{m}/_{m}$ dicker Schaufenster."

Aus den Taltiefen liegen Beobachtungen vor nur von Spiez am Thunersee (ziemlich starkes Donnern in der Richtung gegen die Jungfrau; mehr ein dumpfes Rollen ca. 15 Sekunden lang), und von Unterseen und Ringgenberg bei Interlaken. In Unterseen hörte der Pfarrer während der Predigt einen Knall wie von einem starken Gewehrschuss, in Ringgenberg spürte man „leichte Lufterschütterung" ähnlich wie eine zu Tal stürzende Lawine. Ausdrücklich negative Nachrichten sind eingegangen aus Guttannen, Meiringen und Thun.

Beobachtungen an Höhenorten des Oberlandes: In Reuti (Hasliberg, oberhalb Meiringen, rechte Talseite, 1067 m), hörte man ein Geräusch wie fernes Donnerrollen und eine leichte Lufterschütterung. Auf St. Beatenberg (1148 m) wurde die Explosion sehr deutlich vernommen (ca. $10^h 55$ a); es war ein Geräusch wie von einer gewaltigen Lawine oder einem Bergsturz. Ein Zittern von Gegenständen wurde nicht beobachtet; dagegen verkroch sich vor Angst eine Katze. In Heiligenschwendi (1125 m, oberhalb Thun, rechte Talseite), wurde ein Geräusch wie von fernem Donner gehört.

Auf dem Brünig haben ebenfalls „mehrere Personen die Explosion gehört". — Dass die Explosion im ganzen Berner Oberland als heftiges Erdbeben gespürt worden sei, wie einige Zeitungen berichteten, ist nach alldem eine starke Übertreibung. — Die Erkundigungen über die Wahrnehmung des Schalls auf weiter entfernten Höhenpunkten, ergab folgendes Resultat: Auf den östlich gelegenen Passtationen Grimsel und Furka (Fort Galenhütte) wurde nichts gehört, ebensowenig auf dem St. Gotthard; negativ lauten auch die Antworten der im Nordwesten gelegenen Höhenpunkte, Gurtenkulm (859 m, bei Bern), Mont Soleil (ca. 1280 m oberhalb St. Imier, Berner Jura) und Weissenstein (1284 m, oberhalb Solothurn). Die Gipfel des Napfs (Emmental) und des Brienzer Rothorns, die auch in Betracht zu ziehen wären, sind zu dieser Jahreszeit nicht mehr bewohnt.

Die Zone des Schweigens.

Nach den vorliegenden Beobachtungen hat sich der Schall, die allernächste Umgebung des Explosionsortes ausgenommen, überhaupt nur nach ostnordöstlicher bis nördlicher Richtung an der Erde wahrnehmbar ausgebreitet. Das ist aus der Lage des Explosionspunktes hoch an der nach Norden orientierten Eigerwand verständlich. Aber auch in dieser Richtung liegt ein Zwischengebiet des fast absoluten Schweigens. Bejahende Nachrichten liegen nur vor von zwei Höhenpunkten, dem Pilatuskulm, 2170 m (von drei Arbeitern wahrgenommen, und als Lawinensturz, ferne Kanonenschüsse oder Donner gedeutet), und von der Gegend der Rigi-Hochfluh, wo zwei Bergsteiger, von Lowerz zur Passhöhe des Gätterli (1192 m) aufsteigend, noch ca. 40 m unterhalb desselben auf der Nordseite einige Minuten vor 11^h von Süden her ein starkes donnerähnliches Getöse vernahmen, dem in kurzen Intervallen weitere, bedeutend schwächere Detonationen folgten. Ausdrücklich verneinende Berichte von Höhenpunkten des nach Nordosten gelegenen Gebietes sind auf Anfrage eingelaufen vom Rigikulm (1800 m), vom Zugerberg (ca. 1000 m), vom Utokulm b/Zürich (873 m), ferner von den Zürichsee-aufwärts auf dem gleichen Ufer gelegenen Gipfelpunkten Albishorn (915 m) und Etzel (1102 m), ebenso von dem nördlich des obern See-Endes gelegenen Bachtel (1119 m) und dem benachbarten Sanatorium Wald (910 m). Da also selbst auf den Höhenpunkten dieses ganzen Gebietes nichts gehört wurde, ist umso merkwürdiger eine ganz vereinzelte aus der Talniederung, aus Zürich selbst vorliegende Mitteilung. Die Beobachterin, Frl. E. S., in deren schriftlich und mündlich gemachte Angaben kein Zweifel gesetzt werden kann, teilt mit, dass sie im 2. Stock eines Hauses der Rieterstrasse, an der südlichen Stadtperipherie an der Sihl gelegen, beim Lesen eine ruckartige Bewegung ihres Stuhles fühlte. Das Fenster und einige Gegenstände auf dem Waschtisch klirrten. Das Ganze war von rollendem, dumpfem Geräusch begleitet und dauerte mehrere Sekunden; die Uhr zeigte $10^h 53$; die Angabe sei, bezogen auf die öffentlichen Uhren, als auf ca. 1 Minute zuverlässig zu betrachten. Die Beobachterin überzeugte sich zuerst, dass kein Automobil vorbei gefahren sei, dachte dann an ein Erdbeben, und erkundigte sich bei den Angehörigen, die aber, alle bei einer stehenden Beschäftigung begriffen, nichts gespürt hatten. Das Haus soll leicht durch vorbeifahrende Fuhrwerke erschüttert werden. — Vielleicht liegt ein Zusammentreffen ohne innern Zusammenhang vor.

Das Gebiet der abnormalen Hörweite.

Dies Gebiet liegt ostnordöstlich bis nahezu nördlich von der Explosionsstelle, nach letzterer zu ziemlich exzentrisch begrenzt, und in einem Abstand von 125—140 km beginnend, während die äussere Schallgrenze nach Ostnordosten zu in ca. 180 km, nach Nordnordost in ca. 225 *km* Entfernung liegt. Es umfasst also das genannte Gebiet in der Schweiz einen grossen Teil der Kantone Schaffhausen, Thurgau, St. Gallen und Appenzell. Im Osten liegt auch eine Angabe aus Graubünden vor, und daran schliessen sich zahlreichere Meldungen aus dem Vorarlberg, dem Bregenzerwald, der ganzen Bodenseegegend und dem südlichen schwäbischen Jura sowie dem Schwarzwalde. Bei den folgenden nähern Angaben über das Gebiet der abnormalen Hörweite sollen zur bessern Übersicht zuerst die Gebietsteile links des Rheins, im wesentlichen mit den schweizerischen, und dann jene rechts des Rheins, mit den ausländischen Beobachtungen zusammenfallend, durchgegangen werden.

a) Hörbarkeitsgebiet links vom Rhein.

Wir beginnen im Südosten des Areals. Hier ist der vorgeschobenste Punkt das Säntisobservatorium (2500 m): „wurde hier etwas vor 11h sehr gut gehört; war ein anhaltendes Getöse wie ferner, stark rollender Donner." Die Beobachter glaubten an einen Felssturz. Aus dem Alpsteingebirge sind uns ferner Angaben zugekommen: Vom Fählensee, Punkt 1651, „um $10^h 48$, von Felswand zu Felswand stark rollender Donner." Vom Alpsiegel, in ca. 1700 m Höhe, „ein grollendes Brausen, einen Augenblick aussetzend." Von der Gegend des Hohen Kasten, unterhalb des „Ruhsitz" am Kamor, ca. 1300 m, „ein kräftiges, ziemlich lang andauerndes Donnern; diesem anschliessend zwei kurz aufeinanderfolgende starke harte Schläge." Bei Weissbad, Beobachter in der Wohnstube: „donnerähnliches Geräusch, Zittern der Fenster?" Zwischen Schwendi und Weissbad fiel das eigentümliche Geräusch vielen Kirchgängern auf; zunächst als Donnern, Bergsturz, Erdbebenerscheinung aufgefasst. Eine Zeitungsnotiz erwähnt auch einer Beobachtung auf dem Weg zwischen Appenzell und Weissbad.

Nördlich von Weissbad fehlen im übrigen Berichte bis Gais. Dazwischen ist wohl eine reelle sekundäre Zone des Schweigens anzunehmen, resp. das Säntisgebirge ist eine vorgeschobene Insel des allgemeinen Hörbarkeitsgebietes. Dieses beginnt mit verhältnismässig zahlreichen Angaben, die von hier mit ziemlicher Kontinuität weiter gehen, jenseits des Tales des Rotbaches, eines Zuflusses der Sitter: Gais „einige Minuten vor 11^h schussartiger Knall, gefolgt von starkem Rauschen, sodann in kurzen Zwischenräumen 3—4 weitere solcher Knalle." Bühler: „$10^h 50$, kurz aufeinanderfolgend ein Donnern und doch nicht wie Donner, in der Richtung von Südsüdwest; beobachtet im Freien oder am offenen Fenster. — Von anderer Seite: „Auch in unserm Dorfe . . . einige Minuten vor 11^h eine starke Detonation . . . drei Schläge . . . über die Höhe von Appenzell her" (als SW bezeichnet, ist aber S). Von dritter Seite, beim Hydrantenreservoir von Bühler, 912 m, südlich vom Ort: „In Richtung gegen Säntis heftiges Rollen, dann einige Sekunden still, nachher zwei bis drei Detonationen gleich fernen Kanonenschüssen." Auf der Strasse von Trogen nach Bühler, nordwestlich vom Gäbris, in 990 m Höhe, „von Süden her mehrere Sekunden lang fernes Donnern und Getöse. Die Uhr zeigte 5 Minuten vor 11 Uhr, wird aber der Postzeit wohl einige Minuten vorgegangen sein." Aufstieg von Trogen nach dem Gäbris, in 1075 m Höhe auf dem Kamm . . . „vernahmen wir plötzlich eine Detonation . . . meine Frau war arg erschrocken; ich selber höchst verblüfft und sagte zu meiner Frau: der förmlich unterirdisch rollende Donner liesse ein Erdbeben vermuten." . . . Auf dem Gäbris selbst wurde nichts gehört! — Östlich vom Gäbris, bei der Kellersegg, „eine Reihe von dumpfen Schlägen: für eine Schiessübung gehalten. Von andern nicht weit vorangehenden Leuten als Donner angesehen. „St. Antonskapelle, ca. 1100 m, nordöstlich vom Gäbris: ungefähr $10^h 40$ „6—10 bedeutende Schüsse, die von Artillerie in Entfernung von 3 Stunden Entfernung herzukommen schienen. Der letzte Schuss war der heftigste und bewegte sich auch der Grund unter des Pferdes Füssen, so dass dieses diesmal am meisten stutzte. Es schien mir, als ob der Knall aus dem Nebel heraus, von der Alpsteinkette her käme. Das Geräusch war so heftig, dass die Leute aus den wenigen sich in meiner Nähe befindlichen Häusern herausspringen. . . ." Auf der Strasse nahe bei Wald (Kt. Appenzell): „Da hörte ich und meine werte Frau so um $10^h 50$ heftiges donnerähnliches Rollen, welches dreimal absetzte und immer (-wieder?) stärker klang, aber ohne dass es ganz aufhörte. Dauer 15 Sekunden. Kam dem Anschein nach aus der Gegend von Bregenz (!)." Birt ob Speicher, ca. 1070 m hoch. Hier wurde die Erscheinung vom Beobachter der meteorologischen Station in St. Gallen wahrgenommen: „Ich vernahm plötzlich starken lang anhaltenden Donner; genau $10^h 51$ nach meiner Taschenuhr." Teufen, zwei ähnlich lautende Zuschriften, der eine Beobachter im Freien, der andere im Haus. „donnerartiges Getöse" „Effekt unheimlich und fremd, von Südwesten resp. Westen. Übrige Leute auf der Strasse nicht beunruhigt." Bei Niederteufen im Freien, „starkes Donnerrollen. Uhr zeigte $10^h 52$." Auf dem Brand (südlich von St. Gallen): „Anfangs wie fernes Donnerrollen, dann 2 starke Knalle, wie Sprengschüsse aus einem Tunnel, dann nochmals schwaches Donnern; ganze Zeitdauer 5 Sekunden. Schall vom Säntisgebiet her." St. Georgen, südlich von St. Gallen, im Freien, 10—15 Fussballspieler: „ziemlich starke Detonation." St. Gallen, beim Wildpark, zwei Beobachter im Freien, $10^h 55$: „Langgezogenes Donnern, in das sich drei kurze kanonenschussähnliche Schläge mischten"; ebenso Friedhof Feldli, zwei Personen: „donnerähnliches Rollen, sich im Intervall weniger Sekunden repetierend." Nach Nordosten liegen ferner Berichte vor aus Eggersriet, Wolfhalden (mehrere Beobachter im Freien oder unter

dem Fenster), „4—5 Geschützdonner vom Säntis her; das Haus habe gezittert." Thal, im Freien, „3—4 Schüsse, südwestlich". Endlich zwischen Walzenhausen und St. Margarethen. Vom schweizerischen Bodenseeufer sind Beobachtungen eingelaufen: Von Rorschach, 4 Meldungen, offenbar von vielen im Freien befindlichen gehört, donnerartiges Geräusch aus Südwesten, aus der Höhe kommend, dauerte, unterbrochen von einer kurzen Pause, etwa 8 Sekunden. Genaueste Zeitangabe: ziemlich genau 7 oder 8 Minuten vor 11 Uhr. Von Horn, nordwestlich von Rorschach, 6 Meldungen; wohl ganz allgemein wahrgenommen, „gewaltiger Knall wie Donnerschlag, und 3—4 Nachhalle; Dauer 15—20 Sekunden, kam aus der Richtung St. Gallen (= ca. SW). Zuverlässigste Zeitangaben weisen auf $10^h 50$. Stationsgehülfe Frei gibt an: $10^h 50^1/_2{}^m$. An verschiedenen Orten Klirren der Fensterscheiben, ja vielleicht leises Zittern des Bodens? Von Arbon 3 Berichte; von vielen Leuten wahrgenommen. In einer Klasse von 62 Schülern konnten 10 darüber berichten; „dumpfes Rollen und in Pausen von mehreren Sekunden folgende Detonationen"; ähnliche Angaben wiederholen sich. Richtung von Säntis oder St. Gallen her (SSW). Zeit ca. $10^3/_4$ Uhr. Bei Neukirch (westlich von Arbon), im Freien: „Fernes Donnerrollen, dann 5—6 schnell aufeinanderfolgende Schläge." In Romanshorn (1 Bericht), im Freien: „Gewaltige Detonation, der sofort mehrere folgten." Spitz bei Romanshorn (4 km WSW): „rasch aufeinanderfolgende Donnerschläge im Südwesten", im Haus beobachtet. Keine Hauserschütterung. — Salmsach 1 km südlich von Romanshorn, ebenfalls beobachtet. Kesswyl, 2 Beobachtungen, $10^h 50$, übereinstimmend, „wiederholtes donnerartiges Getöse im Süden." Zuben und Herrenhof bei Altnau, auf der Höhe des Seerückens, je ein Bericht, der eine, im Freien: „zweimal kurz aufeinanderfolgend donnerartigen Schall"; der andere: „sämtliche Familienglieder sprangen erschreckt vom Essen auf." Kurzrickenbach (ca. 5 km SE von Konstanz), im Freien, „zwei aufeinanderfolgende Donnerrollen, aber noch viel schwerer." Siegershausen (ca. 6 km südlich von Konstanz), ziemlich lang andauerndes donnerähnliches Rollen, Fenster klirrten." Steckborn, auf der Landstrasse ob der Stadt, von mehreren Männern beobachtet, in südlicher Richtung, „wie mehrere über eine Brücke fahrende Eisenbahnwagen". Im Homburg (südlich von Steckborn), ebenfalls dumpfes Rollen beobachtet, ebenso in der benachbarten meteorologischen Station Haidenhaus. — Dies sind die westlichsten Angaben links vom Rhein. Dagegen sind noch zwischen diesem Punkt und St. Gallen rückwärts nach Südosten gehend, folgende Hörbarkeitsbeobachtungen zu verzeichnen:

Märstetten, „dumpfes Donnern, Uhr zeigte $10^h 47^m$". Amlikon, südlich davon im Freien, „hörte langes donnerähnliches Rollen sehr gut". Weinfelden, im Freien, „donnerähnliches Rollen in südöstlicher Richtung". Bischofszell, im offenen Fenster, fernes Donnerrollen von SW, mehrere Sekunden; ebenso im Freien eine Stunde östlich von Bischofszell im Sittertal unten, starkes Donnern von SW. Kümmertshausen, unterwegs, „ca. 7—8 Minuten vor 11 Uhr erschreckt durch donnerähnliches Getöse, das zugleich den Boden erzittern machte; nach 1 Sekunde wiederholte es sich in 3 kurz aufeinanderfolgenden verhallenden Schlägen; fing an schneller zu laufen, Gewitter befürchtend"; am selben Ort, zwei andere Beobachter, im Haus, „Gewaltige Detonation, mehr mit sehr rasch aufeinanderfolgenden Kanonenschüssen zu vergleichen, ca. 5 Minuten vor 11 Uhr". Dritter Beobachter: „Das donnerähnliche Rollen auch gehört, ungefähr 7—8 Minuten vor 11 Uhr". Oberaach, mehrere Personen im Freien: Donnerähnliches kräftiges Stossen, dreimal mit Unterbruch von wenigen Sekunden.

b) Hörbarkeitsgebiet rechts vom Rhein.

Der fernste Punkt im Osten ist Arosa (Graub.) 1850 m hoch, im Freien: „2—3 Sekunden dauerndes fernes Donnern aus Westen, etwa 10 Minuten vor 11 Uhr". Nördlich liegen Nachrichten erst wieder vor aus dem Montafoner Tal. Aus Brand bei Bludenz erhalten wir folgende Zuschrift: „Der Schall der Dynamitexplosion an der Jungfraubahn am 15. November a. c. wurde auch im Brandnertal (zwischen Bludenz und Scesaplana) vernommen und zwar sowohl in Bürserberg (ca. 900 m Meereshöhe) an der nach Osten abfallenden westlichen Tallehne, wie in Brand, weiter hinten im Tale (von Nord-Südrichtung), übereinstimmend von fast allen eben vom Gottesdienst heimkehrenden Kirchenbesuchern. Der Schall wird als 3 oder 4 in die Länge sich ziehende Stösse eines dumpfen Donners von im ganzen ca. 4 bis 5 Sekunden Dauer beschrieben, ca. 10 Minuten vor 11 Uhr. Der Donner schien von Westen her von den Bergen herunter zu kommen." Thüringen, NW von Bludenz, im Bureau, 2 Beobachter: „Länger andauerndes donnerähnliches Rollen, leises Klirren der Fenster." Feldkirch, im Freien: „Kurz vor 11 Uhr direkt über mir plötzlich ganz deutliches Donnern, das 10—15 Sekunden andauerte." Drei Schwesterngruppe, südlich von Feldkirch, 5 Personen auf der Jagd: „Kurz nach $^3/_4$ 11 Uhr Donnerrollen wie von fernem Gewitter, und einige Sekunden darauf Gefühl, wie wenn der Boden erschütterte und die Berge in sich zusammenstürzen würden. Die Hunde gebärdeten sich ängstlich." Dornbirn, 4 Zuschriften, wovon 3 auf den Ort selbst sich beziehen; Zeitangaben: $10^h 55$, 53, 54^m, im Haus beobachtet: „rollendes Geräusch, dann Kanonade", die andern ähnlich. Dauer zu 2, 6—8 und 10 Sekunden angegeben. Fenster klirrten. Im Freien auf den Höhen als aus der Höhe kommend empfunden. Offenbar allgemein beobachtet. Die von den Zeitungen angegebene Erderschütterung wird von einzelnen Beobachtern ausdrücklich verneint. Losenpass (1174 m) bei Dornbirn, zwei Beobachter im Freien: „Mehrere rasch aufeinanderfolgende scharfe Donnerschläge, sich in 6—8 Sekunden verlierend; Zeit $10^h 53^m$ nach Bahnuhr kontrolliert. Die Erscheinung wurde von allen Touristen in jener Gegend bemerkt: schien allen aus der Höhe kommend. — Auch weiter östlich im Tal der Bregenzer Ach, in Schwarzenberg und in Au wurde die Detonation gehört, und zunächst als Erdbeben taxiert. Es ist von Klirren der

Fenster und Erderschütterung die Rede. Die Post Hittisau meldet, das „Erdbeben" sei im ganzen Vorderbregenzer Wald sehr deutlich gespürt worden, mit Explosionsschlägen und unterirdischem Donner, 20 Sekunden dauernd. Vom rechten Bodenseeufer sind Nachrichten vorhanden von Lauterach, Hard, Rieden bei Bregenz, von Bregenz selbst, und von Lindau. Dem Tagblatt von St. Gallen wird geschrieben: „Vom Bodensee. Sonntag vormittags gegen 11^h wurde die Bevölkerung des westlichen Teiles von Bregenz, sowie der Nachbargemeinde Rieden-Vorkloster, Hard und Lauterach durch eine deutlich wahrnehmbare heftige Erderschütterung aufgeschreckt, die sich von Südwest nach Nordost bewegte, etwa 15 Sekunden in mehreren Intervallen währte und auch im benachbarten Lindau verspürt wurde. Die Erschütterung war so stark, dass Passanten auf der Strasse den Boden unter den Füssen wanken fühlten und gleichzeitig ein leise zitterndes Rollen im Innern der Erde verspürten. Am Seeufer war sogar ein schwacher Donner vernehmbar. Die Strassenlaternen klirrten und die Fensterscheiben, und in manchen Häusern gingen die Türen von selbst auf. Auch wurde mehrfach ein starkes Gläserklirren in Glasschränken beobachtet." Die uns direkt zugegangenen Meldungen drücken sich weniger stark aus! Bregenz, im Zimmer: „Rollen, wie wenn es donnerte; wurde immer stärker; ich meinte, es klopfe jemand von aussen an die Scheiben." Aus Lindau und Umgebung (Schachen, Rickenbach, auf dem Pfändler) liegen vier Angaben vor, wonach dort eine Reihe schnell aufeinanderfolgender Donnerschläge gehört wurden. („Drei dicht aufeinanderfolgende . . . denen nach ca. 2 Sekunden ein vierter folgte".) Richtung aus SW, oder „vom Säntisgebirge" = SSW wird angegeben. Ein Beobachter erwähnt das Klirren der Fenster, ein anderer das schwache Zittern einer geschlossenen Tür. In Reuti bei Lindau traten die Leute erschreckt aus den Häusern; es wurden zwei „Stösse" von je 10—12 Sekunden Dauer mit einer Pause von 3 Sekunden verspürt. Weiter hinab am Seeufer wurde die Explosion gehört in Nonnenhorn, Friedrichshafen, Immenstaad (Zeitung). Meersburg, $10^h\,50^m$, „8—10 dumpfe Schläge vom See her, Erzittern des Hauses bewirkend; aber weder Erdbebenschwankungen noch Seeschiessen". Weiter landeinwärts auch in Marktdorf, Salem, Heiligenberg. Nordwestlich vom Bodensee sind Angaben vorhanden von Stockach, und westlich davon aus Volkartshausen, Eigeltingen. In letzterm Ort habe (Zeitungsmeldung!) der Pfarrer den Küster auf den Kirchturm geschickt, um nachzusehen, ob die Glocken nicht auf die Orgel herabgestürzt seien. Nordöstlich von Stockach sind Meldungen da von Zizershausen, Mindersdorf, Messkirch, Göggingen („donnerähnliches Getöse im Freien, drei Stösse, Fenster klirrten"), Rohrdorf („wellenförmig, einem Donner gleich, wobei die Fenster zitterten"). Weiter westlich kommen zunächst einige Orte in der Gegend von Schaffhausen, nämlich Lohn (kurz vor 11 Uhr fiel ein Stück Gips von einer Zimmerdecke, so dass die Hausbewohner unter sich von der Möglichkeit eines Erdbebens sprachen). Bargen (wie Geräusch von entfernten Flintenschüssen) und Weizen (b/Schleitheim) „donnerähnliche Detonation gegen Süden". Nördlich davon: Immendingen, im Freien (von Süden starkes Donnern, dann 8—10 äusserst heftige Detonationen; Zeit $10^h\,52^m$). Tuttlingen und Umgebung, 5 Meldungen, ähnlich lautend; so von einem Beobachter im Freien: „$10^h\,55$ donnerähnlicher Schlag, nach 10 Sekunden zweiter Schlag, zwischenhinein dumpfes Rollen, das nach dem zweiten Schlag schrillklingend wurde und wieder einige Sekunden anhielt." Von Süden her noch zwei Angaben. Spaichingen. „Wie schnell aufeinanderfolgender Kanonendonner." Dreifaltigkeitsberg bei Spaichingen, 982 m, „derart vernommen, dass ich einen Herrn ans Fenster rief. Es war direkt gegen die Jungfrau zu, welche man hier ja bei hellem Wetter gut sieht: die Detonation war gewaltig, eine Art von Artillerieschnellfeuer; wurde über den ganzen Heuberg gehört". Weiter nördlich werden (Zeitungsnachricht) noch Rottweil und sogar Rottenburg a/N. („wie ferner Artilleriedonner") genannt, weiter westlich Schwenningen, 3 Meldungen, genaueste Zeitangabe $10^h\,59^m$; mehrere (nach den einen zwei, nach andern im Freien befindlichen fünf) mächtige Schläge. Erdbebencharakter wird von dem einen Beobachter ausdrücklich verneint. Königsfeld, „ca. 11 Uhr Erderschütterung, gefolgt von donnerähnlichem Rollen. Geräusch von Türen und Fenstern." Aus dem Schwarzwald liegen ferner Meldungen vor in der Richtung auf Freiburg zu, aus Eisenbach „zwischen $10^3/_4$ und 11 Uhr auch hier in den Wohnungen donnerähnliches Rollen; auf der Strasse als von SE nach NW ziehend beurteilt. Vöhrenbach, „etwa um 11 Uhr gegen Süden Donnergetöse, sofort gefolgt von 8—10 einzelnen Schlägen. Der Boden zitterte nicht." Furtwangen (Zeitungsnotiz): „heftige Erderschütterungen 6 Minuten vor 11 Uhr . . . kurz hintereinander zwei heftige Stösse, von donnerähnlichem Rollen begleitet. St. Peter: „Um $10^h\,55$ in südwestlicher Richtung donnerartiges Getöse, das explosionsartig („explusionenlich") in kurzem Abstand von 5 Sekunden, ca. $^1/_2$ Minute dauerte." Kollnau: „gegen $^3/_4$ 11 Uhr eine Erderschütterung mit dumpfem Rollen, hier im Hause und auf der Landstrasse bemerkt." Auch sonst aus dem Elztal, nach Zeitungsnotiz! (16. Nov.), „in verschiedenen Orten des Tales wellenförmige Erdbewegung, die an manchen Stellen sehr heftig in die Erscheinung trat". Endlich der entfernteste Ort, von wo direkte Nachrichten — und zwar sehr bestimmte — vorliegen: Gärtnerberg, 590 m, bei Rippoldsau (Freudenstadt), 3 Beobachter: „Starke Detonation, der donnerähnliches Rollen von 10—15 Sekunden folgte und zum Schluss nochmals kanonenschussähnlicher Schlag; ziemlich direkt von Süden. Zeit $10^h\,54$ a."

Allgemeines.

Übersehen wir das Gebiet der Hörbarkeit, so fällt eine ziemlich verschiedene Dichte der Beobachtungsorte und Meldungen auf. Dieselbe ist am grössten östlich von St. Gallen und an dem obern Bodenseeufer. Das Fehlen von Nachrichten vom Bodensee gegen Ravensburg zu ist etwas sonderbar, verglichen mit den verhältnismässig zahlreichen

Beobachtungen nördlich vom Ueberlinger See bis in den südlichen Schwarzwald, in der Richtung auf Freiburg zu. Dabei ist zu berücksichtigen, dass noch an isoliert dastehenden Punkten, wie z. B. Rippoldsau oder Brandner Tal b. Bludenz, das Geräusch doch recht stark vernommen worden ist. Das Ziehen der Hörbarkeitsgrenze macht deshalb einige Bedenken: es bleibt fraglich, ob einige Einbuchtungen nur zufällig oder reell sind und ob nicht das Gebiet sogar in eine Anzahl Hörbarkeitsinseln zerfällt. Immerhin scheint der innere Verlauf der Grenze ziemlich sicher zu sein. Reell ist wohl das Vorspringen des Säntisgebietes (hohe Beobachtungspunkte!), ebenso das Schallschattengebiet des Rheintals. (S. d. Karte.)

Die Art des Schalls wird von den meisten als donnerähnlich geschildert, oft so, dass das donnerähnliche Rollen eingeleitet, unterbrochen oder beendet worden sei durch einige kanonenschussähnliche Schläge. Bei einigen ist überhaupt nur von explosionsartigen Schlägen die Rede. Eine deutliche Abhängigkeit des Geräuschcharakters oder der Intensität von der Entfernung oder überhaupt eine regionale Anordnung ist innerhalb des abnormalen Gebietes nicht erkennbar. Dagegen scheint in diesem letztern die Intensität stellenweise bedeutend grösser gewesen zu sein als an den meisten Punkten des „normalen" Gebietes. Die Dauer wurde in Arosa, dem östlichsten Punkt zu 2—3 Sekunden, sonst zu 5—10 Sekunden, im nördlichsten Gebiet auch zu 15—30 Sekunden geschätzt; einzelne Angaben sprechen sogar von 1—2 Minuten. Eine Zunahme der Dauer mit grösserer Entfernung ist angedeutet.

Eine mechanische Wirkung des Schalls zeigte sich in dem öfter erwähnten Klirren der Fensterscheiben; es scheinen aber auch da und dort Häuser zum Erzittern gebracht worden zu sein, nach dem subjektiven Eindruck der Beobachter oder objektiven Feststellungen, wie leises Klappern einer Tür (Reuti bei Lindau, von wo auch Klirren von Glassachen in den Schränken und von Strassenlaternen in den Zeitungen gemeldet wird) und Herabfallen eines Stückchens Gipsdecke (Lohn).

Die Auffassung als Erdbeben; Wirkung auf Tiere und Menschen. Es wird ängstliches Verhalten von Pferden, Hunden, Katzen, Hühnern berichtet. Ein kleines Kind suchte Schutz bei der Mutter. Auch auf Erwachsene machte der unerklärliche, starke Schall vielerorts einen geradezu erschreckenden Eindruck, da der Sonntag und die späte Jahreszeit von vorneherein einige sonst naheliegende Erklärungen ausschlossen. Am Bodensee dachten manche ans Seeschiessen; an verschiedenen andern Orten glaubte man zunächst an eine Erdbebenerscheinung, weil man das Ungewöhnliche der Wahrnehmung sonst zunächst nicht heimzuweisen wusste.

Ein grosser Teil der Angaben aus Baden und Württemberg sind als Erdbebenmeldungen eingegangen. Charakteristischerweise reden aber fast nur die Zeitungsmeldungen*) ausdrücklich von Erdstössen, während die direkten brieflichen Mitteilungen nur ganz vereinzelte und dazu in keinem Falle zwingende dahingehende Angaben enthalten, hingegen öfters den Erdbebencharakter ausdrücklich in Abrede stellen, ebenso wie die Hypothese eines starken „Seeschiessens" am Bodensee. Die meisten Angaben betonen geradezu den ausschliesslichen Schallcharakter des Phänomens und dessen Herkunft durch die Luft. Beachtenswert ist die da und dort, namentlich aber im Vorarlberg sich findende Bemerkung: Der Schall sei aus der Höhe herabgekommen.

Die uns durch die Württembergische meteorologische Zentralstation vermittelten Angaben würden allerdings, nicht im Rahmen der andern Nachrichten, sondern für sich allein genommen, auf die Annahme eines Erdbebens geführt haben. Sie lauten folgendermassen:

1. Von dem meteorologischen Beobachter Herrn Lehrer Butz in Böttingen O.-A. Spaichingen: 15. November „11h 05a ein etwa 35—40 Sekunden dauerndes wellenförmiges Erdbeben. Dasselbe verlief von NE nach SW und war so stark, dass einzelne Fenster klirrten. Etwa 1/4 Stunde später wurde ein zweiter, weniger heftiger Erdstoss verspürt. Das Geräusch glich fernem Trommelschlag."

2. Ein Ausschnitt aus „Münchner Neueste Nachrichten" 17. November 1908, No. 538. Erdbebenbericht von Lindau. Zeit: 11h a; ein deutlich wahrnehmbares Erdbeben. Bewegung von SW nach NO, Dauer 20 Sekunden.

3. Ausschnitte aus dem „Oberschwäbischen Anzeiger" vom 17. November 1908. „Eine besonders starke Ausprägung des Seeschiessens wurde Sonntag Vormittag gegen 11 Uhr am Bodensee beobachtet. Allenthalben am Seeufer wurde um diese Zeit eine Detonation wie von anhaltendem Artilleriefeuer oder einem rasch ausbrechenden Gewitter vernommen. In Friedrichshafen wurde dabei ein Erdstoss verspürt."

„In Heiligenberg und Hagnau wurden Sonntag Vormittag 11h 07 *und 11h 30m* mehrere Erdstösse beobachtet, die von donnerartigem Getöse begleitet waren."

„Am Sonntag Vormittag wurde ein ziemlich heftiges Erdbeben, begleitet von starkem Getöse, wahrgenommen. Verschiedentlich sollen mittags 2 Uhr weitere Stösse beobachtet worden sein."

Auffällig ist in diesen Berichten, dass die Zeitangaben 11h 05 und 11h 07 aus dem Rahmen der übrigen herausfallen, und dass noch von einem spätern Erdstosse die Rede ist, „1/4 Stunde später — 11h 30 — gegen 2 Uhr". Doch liegen zufällig sowohl von Spaichingen wie von Heiligenberg und Lindau auch andere Meldungen vor, die mit der Zeit wie mit den andern Angaben von diesen Ausnahmeberichten abweichen und zum allgemeinen Bild passen. Was die spätern Stösse betrifft, sind sie vielleicht unter dem Gesichtspunkt der Autosuggestion zu betrachten zusammen mit einer Angabe aus Horn: „eine alte Frau wolle schon am frühen Morgen ähnliches gehört haben". Ganz ist es ja nicht von der Hand zu weisen, wenn auch innerlich und äusserlich höchst unwahrscheinlich, dass ungefähr gleichzeitig, oder wenig später, vielleicht angeregt durch die gewaltige Luftwelle der Explosion, wirklich eine kleine Erderschütterung stattgefunden hätte.

*) Bei deren Verwertung so willkommen oft diese Angaben sind der wissenschaftliche Bearbeiter, wie erfahrungsgemäss meistens, so auch wohl in diesem Fall einen gewissen Abstrich machen und jedenfalls an die Tendenz der Einsender zu sensationeller Darstellung denken muss.

Zeitangaben. Die Kontinuität der Zeitangaben, die da, wo sie einigermassen sorgfältig gemacht sind, übereinstimmen, lässt sonst keinen Zweifel, dass überall ein und dieselbe Erscheinung beobachtet worden ist. Die Explosion ist eingetreten um $10^h 45^m$ nach Angabe des Jungfraubahnbureaus, um $10^h 47^m$ nach der Angabe des Telegraphenbureaus Grindelwald. Aus dem Gebiete der normalen Hörweite liegen sonst keine genauen Angaben vor; auch im Areal der abnormalen Hörweite ist meistens nur gesagt: „Kurz vor 11 Uhr" oder „Zwischen 10 und 11 Uhr". Folgende Angaben aus diesem Gebiet sind genauer (es sind nur diejenigen angeführt, bei denen die einzelne Minute angegeben ist):

Entf.	Zeit	Ort	Bemerkg.	Entf.	Zeit	Ort	Bemerkg.
ca. 132 km	$10^h 48$	Fählensee		ca. 163 km	$10^h 53$	Dornbirn	(Bahnzeit)
„ 140	52	Teufen		„ 168	49	Lindau	(Schweiz. Bahnz.)
„ 142	55	St. Gallen		„ 170	56	Heiligenberg	
„ 141	47	Märstetten		„ 170	55	Heiligenberg	
„ 144	51	Speicher	(Bahnzeit)	„ 164	54	Furtwangen	
„ 152	$50^1/_2$	Horn	(Bahnzeit?)	„ 161	52	Immendingen	
„ 152	54	Arbon	(Bahnzeit)	„ 167	55	Tuttlingen	
„ 163	54	Dornbirn		„ 170	59	Schwenningen	
„ 163	53	Dornbirn		„ 206	54	Rippoldsau	

Das Mittel aus den Entfernungen dieser Orte vom Explosionsort ist 161 km, die mittlere Zeit der Beobachtung $10^h 52^m 8^s$. Die Geschwindigkeit des Schalls zu 333 m genommen, unter Voraussetzung einer Temperatur von 0 Grad, die für die fraglichen Luftschichten annähernd zutreffen dürfte, ergibt sich eine Schallfortpflanzungszeit von 8.0 Minuten, und darnach die Zeit der Explosion zu $10^h 44^m$, was mit den oben angeführten Angaben $10^h 45$ und $10^h 47$ genügend stimmt, um zu beweisen, dass es sich um den durch die Luft fortgepflanzten Schall von der Jungfraubahnexplosion handelt.

Die meteorologischen Verhältnisse. Dieselben dürfen nicht unberücksichtigt bleiben, da sie, wie unten ausgeführt wird, auf die Verbreitung des Schalls einen wesentlichen Einfluss haben. Über Frankreich und südlich davon über dem Mittelmeer lag eine barometrische Depression (761 m/m), über Westrussland ein ungewöhnlich intensives Hochdruckgebiet (785 m/m). An seiner Vorderseite wehten starke südöstliche Winde, die jedoch, wenigstens am Erdboden, das in Betracht kommende Gebiet nicht erreichten. Auch die Altocumuluswolken (in ca. 4000 m Höhe anzunehmen) hatten nach Angabe des Säntisobservatoriums keine merkliche Bewegung. Der Wind war in der Tiefe schwach und unbestimmt, meist nordöstlich, in der Höhe ebenfalls sehr schwach, aus S bis SE. Das Gebiet der Schweiz, auch das Rheintal und die Bodenseegegend, war von einem Nebelmeer bedeckt, das (nach Angabe des Säntis), im Lauf des Tages von 800 bis 1200 m stieg, und zur Zeit der Explosion nach verschiedenen Angaben am Vierwaldstättersee bis zu ca. 1000 m (am Pilatus 800 m), im Säntisgebiet bis 1030 m reichte, und hier zugleich dem Boden auflag, in Zürich bis 600 m hinabreichte. In der Höhe war der Himmel nicht hell, sondern von einer Altocumulusschicht bedeckt. Im Laufe des Tages fielen an einigen Orten verschwindend kleine Niederschläge.

Die Temperaturverteilung in der Vertikalen wird gegeben durch folgende Zahlen (für 7a und 1p):

Thun	566 m: 4.1, 9.2° C	Beatenberg	1148 m: 8.0, 8.2° C
Zürich	493 m: 5.3, 6.2° C	St. Gallen	702 m: 3.6, 3.0° C
Heiden	797 m: 3.0, 3.4° C	Schwäbrig	1152 m: 5.1, 4.8° C
Pilatus	2068 m: 0.7, 0.8° C	Rigi	1787 m: 2.6, 3.0° C

Säntis 2500 m (10a): −2.1, −2.3° C

Darnach, und nach den Messungen der Drachenstation am Bodensee vom Vortag und Nachtag — am 15. Nov. hat kein Aufstieg stattgefunden — ist innerhalb des Nebels eine Temperaturabnahme von 1—2 Grad, oberhalb desselben zunächst eine nicht sehr starke, vielleicht 2—3 Grad betragende Temperaturzunahme, und darüber wieder eine Abnahme von 0.5 bis 0.7° pro 100 m anzunehmen.

Erklärungsmöglichkeiten der eigentümlichen Schallverbreitung; der Einfluss von Temperaturverteilung und Windbewegung auf die Schallbahnen.

Ein erschöpfender Erklärungsversuch liegt ausserhalb der Aufgabe dieser Darstellung. Immerhin seien einige wesentlichen Punkte erörtert und untersucht, unter welchen Bedingungen eine Schallverbreitung wie die beobachtete überhaupt stattfinden konnte.

Dass der Schall sich nur in dem Quadranten NE verbreitet hat (siehe die Karte), erklärt sich aus der Lage des Explosionsortes mitten an der riesigen, nach N schauenden Bergwand. Dabei fällt allerdings auf, dass der Schall nicht weiter nach NW gehört worden ist.

Das Gebiet des Schweigens kann, was die tiefern Punkte betrifft, als direkter Schallschatten der vor dem Explosionsort gelegenen diesem an Höhe nahezu gleichkommenden ja ihn z. T. übertreffenden Gebirgszüge erklärt werden. Das genügt aber nicht für eine Anzahl oben angeführter Höhenpunkte, welche vielleicht durch geradlinige Schallstrahlen

erreichbar wären. Hier ist zu erinnern an die Tatsache, dass der Schallstrahl sich nur dann geradlinig fortpflanzt, wenn die Schallgeschwindigkeit in der ganzen Schallbahn die gleiche ist. Die Schallgeschwindigkeit ist aber abhängig von der mechanischen Fortführung der Luft durch die Windströmung, und von der Elastizität der Luft, die ihrerseits von der Temperatur (nicht vom Luftdruck!) abhängt. Die Wirkung dieser Faktoren ist so, dass bei Temperaturabnahme mit der Höhe (ebenso bei Zunahme der Windgeschwindigkeit mit der Höhe bei nach dem Schallort hinwehendem Wind) die Schallbahnen gegen den Boden konvex gekrümmt sind. Die von einer in einer gewissen Höhe gelegenen Schallquelle ausgehenden Schallstrahlen erreichen also unter diesen Bedingungen von einer gewissen Entfernung an überhaupt den Erdboden nicht mehr, sondern werden vorher in die Höhe gelenkt; ist der Sinn der Temperaturverteilung und der Windänderung mit der Höhe umgekehrt, so tritt auch umgekehrt eine Krümmung der Schallstrahlen konkav nach dem Erdboden zu ein. Diese Tatsachen spielen eine wesentliche Rolle bei der Erklärung der wechselnden Hörweite des Donners, und der Nebelsignale an den Küsten. Wenn die Höhe h des Schallortes über der Erdoberfläche, die Temperaturabnahme Δt und die Windzunahme Δw in der Richtung gegen die Schalquelle zu pro 100 m mit der Höhe gegeben sind, berechnet sich die maximale X Schallweite auf der Erdoberfläche (nach *Schtötz*, *Mohn* und *Meinardus* siehe Annalen der Hydrographie 1892, Seite 85 und „Meteorologische Zeitschrift“ 1895, Seite 14) nach der Formel

$$X = \sqrt{\frac{h}{k}} \text{ Meter, wobei } k = 0{,}0000092\, \Delta t + 0{,}0000156\, \Delta w.$$

Bei einer Temperaturabnahme von 0.6° und der Annahme ruhiger Luft, den damaligen Verhältnissen entsprechend, ergibt sich für eine Höhe der Schallquelle von 2000 m über der Ebene eine maximale Schallweite von 19 km; hatte der Beobachtungsort die gleiche Höhe über der Ebene wie die Schallquelle (z. B. Säntis), so war die maximale Schallweite 38 km. Auf grössere Entfernungen wäre also unter den gegebenen Bedingungen normalerweise der Schall nicht mehr hörbar gewesen. Die positiven Berichte vom Pilatus und Rigihochfluh, in 50—60 km Entfernung, stimmen hierzu nicht ganz. Hierbei ist immer eine ungehinderte Ausbreitung vorausgesetzt und von einer Beugung der Schallwellen abgesehen.

Kann man nach allem Gesagten die negativen Nachrichten auch der Höhenpunkte der Schweigenszone verstehen, ja voraussehen, so bleibt die Hauptsache um so erklärungsbedürftiger, wie nämlich in dem Gebiet anomaler Hörbarkeit die Schallwellen doch wieder zum Boden herabgelangt sind, in einer Entfernung von 127 km (Säntis) bis 140 km.

Dreierlei Möglichkeiten können den Witterungsumständen jenes Tages nach in Betracht gezogen werden: 1. Eine Begünstigung der Schallfortleitung durch die an der obern Grenze des Nebelmeers anzunehmende Temperaturumkehrung. 2. Eine Zurückleitung der Schallstrahlen durch Reflexion etwa an der tatsächlich in ca. 4000 m bestehenden Wolken- (A-Cu, A-Str) -schicht. 3. Ein Zurückkehren der Schallwellen infolge von Brechung in den höhern Schichten der Atmosphäre, wo entsprechende Windbewegung anzunehmen wäre. Diese drei Möglichkeiten sollen im Folgenden kurz besprochen werden.

1. In der Grenzschicht, da wo die innerhalb der Nebeldecke mit der Höhe abnehmende Temperatur nun wiederum zunimmt, ist allerdings die physikalische Bedingung für eine sehr weite Fortleitung horizontaler Schallwellen gegeben, da diese weder nach oben noch nach unten die Schicht verlassen können. Aber doch genügt dies als allgemeine Erklärung den Tatsachen nicht, vor allem nicht jener, dass die Explosion auch an solchen hohen und z. T. seitlich abgeschlossenen Punkten wie Säntis und Fählensee zunächst gehört und andererseits von einer bestimmten Entfernung an auch durch den Nebel hindurch in der Tiefe vernommen wurde.

2. Für die Betrachtung der Reflexion des Schalls an der Wolkenschicht setzen wir voraus, dass es sich handle um eine Totalreflexion der Schallwellen an einer für die Schallfortpflanzung diskontinuierlichen Schicht, gebildet durch einen Temperatursprung (Umkehr) oder eine plötzliche Änderung der Windgeschwindigkeit. Solche treten erfahrungsgemäss am ehesten in Verbindung mit einer Schichtwolke auf. Zunächst der Grenzwinkel, von welchem an Totalreflexion stattfindet, ergibt sich aus den Beziehungen $\frac{v_1}{v_2} = \frac{\sin \alpha}{\sin \beta} = n$, wobei die Schallgeschwindigkeit v_1 kleiner sein muss als v_2. Wird $\beta = 90°$ gesetzt, so ergibt sich der Grenzwinkel $\sin \alpha = n$. Für eine plötzliche Windzunahme an der Grenzschicht von je 5, 10 und 20 m ergeben sich die Grenzwinkel 10° 0′, 13° 30′ und 19° 20′. Den gleichen Grenzwinkel wie ein Windsprung von 5 m würde eine plötzliche Temperaturzunahme von 8.5° bewirken; eine solche ist in der in Betracht kommenden Höhe der Atmosphäre so gut wie ausgeschlossen, während ein Windsprung von 5 m meteorologisch plausibel erscheint. Eine solche Sprungschicht in der Höhe der Altocumuluswolken, rund 1500 m über dem Explosionsniveau, also bei etwa 4200 m angenommen, würden, bei einer Temperaturabnahme von 0.6° auf 100 m und ruhiger Luft, jene Schallstrahlen in 4200 m Höhe eben noch unter dem Grenzwinkel ankommen, welche vom Explosionsort horizontal ausgingen. Sie würden in Abständen von ungefähr 32 km immer wieder an die Grenzfläche zurückkehren, und von neuem reflektiert werden. Der tiefste Punkt dieser Schallbahnen würde aber nicht unter die Höhe des Explosionspunktes hinabsteigen, so dass die Annahme einer Totalreflexion im Altocumulusniveau keine Erklärung für die tatsächlich beobachteten Phänomene bietet. Es sei noch bemerkt, dass jene Schallstrahlen, welche die Schallquelle nicht annähernd horizontal verlassen, unter den angenommenen Bedingungen nicht mehr total reflektiert würden. Um einen grössern Teil der

Schallstrahlen total reflektieren und sich nach der Reflexion der Erdoberfläche mehr nähern zu lassen, müsste das Diskontinuitätsniveau oder der Betrag des Windsprungs nach der Richtung des Unwahrscheinlichen verschoben werden.

3. Wir gehen also über zur Betrachtung der Annahme einer graduellen Windzunahme oberhalb des Altocumulusniveaus: dann kommt nicht mehr Reflexion, sondern Brechung in Frage. Die Temperaturabnahme möge 0.6° sein, wie für die tiefern Schichten gefunden, und bis 4200 m hinauf ebenfalls angenommen wurde. Die Windzunahme möge konstant sein und möge erst in 4200 m, oberhalb der Altocumulus beginnen. Unterhalb sei die Luft ruhig. Beides stimmt mit den Beobachtungen, soweit solche vorhanden sind. Ein stärkerer Süd- bis Südwestwind in grösserer Höhe ist auch mit der Luftdruckverteilung jenes Tages sehr gut vereinbar. Es muss die Bedingung erfüllt werden, dass der Schallstrahl wieder bis zur Erde zurückgebrochen wird. Hierzu muss er, bei den gemachten Voraussetzungen, das Niveau von 4200 m unter einem Winkel von $(90° - i) = 14.5°$, resp. 15.0° zur Horizontalen treffen, je nachdem wieder ein Erdbodenniveau von 750 resp. 500 m erreicht werden soll. — Durch eine Windzunahme von 0.35 m würde, beiläufig bemerkt, die nach oben ablenkende Brechungswirkung der Temperaturabnahme gerade aufgehoben, und eine geradlinige Schallbahn bewirkt werden; bei 0.5 m Windzunahme, die wir annehmen wollen, würde die Schallbahn schon nach dem Erdboden konkav gekrümmt sein, mit einem Krümmungsradius von 225 km [1]). Die Schallstrahlen würden 112 km entfernt von der Eintrittsstelle wieder ins Altocumulusniveau zurückkehren, nachdem sie sich bis 7100 m über dasselbe erhoben. Die darunter liegenden Anfangs- und Endstrecken von der Schallquelle an und bis zum Erdboden zurück, je 8 und 20 km, ergeben 140 km für die totale Entfernung der innern Grenze des anomalen Hörbarkeitsgebietes, in Übereinstimmung mit den Tatsachen. Die Schallstrahlen wären dann im höchsten Teil ihrer Bahn bis 11 300 m gestiegen, wo die Windgeschwindigkeit 35 m betragen hätte. Dieser Betrag ist bei der Luftdruckverteilung jenes Tages wohl denkbar, immerhin etwas hoch. Aber bei einigen plausiblen Änderungen in den übrigen Annahmen würde auch eine etwas geringere Maximalgeschwindigkeit genügen. Dies näher zu zeigen, die Bedingungen auch für die in grösserer Entfernung als 140 km zur Erde zurückgekommenen Schallwellen aufzustellen, die Rolle der dabei in Betracht kommenden sogenannten obern Inversion oder Troposphäre zu erörtern und die Rundung der Erde zu berücksichtigen, würde hier zu weit führen. Es genügt, nachgewiesen zu haben, dass die beobachtete Schallverbreitung unter meteorologisch plausibeln Voraussetzungen physikalisch quantitativ erklärbar ist.

Zum Schluss sei noch erwähnt, dass in der Literatur der letzten Jahre schon zwei Fälle von Dynamitexplosionen beschrieben sind, bei denen ähnliche Schallanomalien auftraten [2]). In beiden Fällen lag das Gebiet anomaler Hörweite in ähnlicher Entfernung wie in unserm Fall, 125—140 km westlich vom Explosionsort: im zweiten ist uns die betreffende Kartendarstellung, die leider nicht zur Veröffentlichung gelangt ist, durch die Liebenswürdigkeit des unten genannten Bearbeiters zur Einsicht vorgelegt worden. In jenen Fällen kommen Berghindernisse zur Erklärung des Schweigensgebietes nicht in Frage. Die Annahmen unseres Versuchs, den Schall auf dem Wege der höhern Luftschichten nach dem Gebiet der abnormalen Hörbarkeit gelangen zu lassen, gewinnen an Wahrscheinlichkeit, wenn man jene Fälle beizieht, und können wiederum zur bessern Erklärung derselben dienen.
